1. Preface

Who is this guide aimed at?
What is Panda Endpoint Protection / Plus on Aether?
Panda Endpoint Protection and Panda Endpoint Protection Plus Icons
1.1. Introduction

This guide contains basic information and procedures for making the most out of Panda Endpoint Protection / Panda Endpoint Protection Plus on Aether.

1.2. Who is this guide aimed at?

This guide is aimed at network administrators who need to manage the security of their organization’s computers, find out the extent of the security problems detected, and define cyber-attack response and prevention plans.

1.3. What is Panda Endpoint Protection / Plus on Aether?

Panda Endpoint Protection / Plus is a managed service that delivers security without requiring active, constant intervention from the network administrator. It offers highly detailed information about the security status of the IT network thanks to the new Aether platform developed by Panda Security. Aether is a scalable and efficient platform for the centralized management of Panda Security solutions, addressing the needs of key accounts and MSPs. Aether facilitates the real-time presentation of information generated by Panda Endpoint Protection / Plus about processes, the programs run by users and the devices installed, in a coordinated and highly detailed manner.

1.4. Panda Endpoint Protection / Panda Endpoint Protection Plus

This guide covers the products Panda Endpoint Protection and Panda Endpoint Protection Plus. Since both products share multiple features and work on the new Aether platform, this guide refers to both solutions with the names Panda Endpoint Protection / Plus and Panda Endpoint Protection / Plus on Aether. Those features that are only available in Panda Endpoint Protection Plus are indicated with the icon 🌓.

1.5. Icons

The following icons are used in this guide:

- Additional information, such as an alternative way of performing a certain task
- Suggestions and recommendations
Important advice regarding the use of features in *Panda Endpoint Protection / Plus*

Additional information available in other chapters or sections of the guide

Feature only available in *Panda Endpoint Protection Plus*
2. Introduction

Key product features
Key platform features
Key components of the platform architecture
Services
Product user profile
Supported devices and languages
Resources and documentation
2.1. Introduction

Panda Endpoint Protection and Panda Endpoint Protection Plus are two security solutions that leverage multiple protection technologies, allowing organizations to replace the on-premises or standalone antivirus solution installed on their network with a complete, cloud-based managed security service.

Both products combine an extremely lightweight security software installed on network computers with a single Web management console accessible at anytime, anywhere and from any device.

Additionally, Panda Endpoint Protection Plus allows organizations to monitor and control user productivity, preventing access to Web resources not linked to the company's activity and filtering corporate mail to eliminate spam-related performance problems.

Panda Endpoint Protection and Panda Endpoint Protection Plus enable administrators to manage security simply and centrally from a single Web console, without the need to install new infrastructure to control the service and thereby reducing the total cost of ownership (TCO).

Finally, both are cloud-based cross-platform products compatible with Windows, MacOS, Linux and Android devices. With Panda Endpoint Protection and Panda Endpoint Protection Plus, you'll only need one tool to ensure the security of all devices in your organization.

2.2. Main benefits of Panda Endpoint Protection / Plus on Aether.

Panda Endpoint Protection is a product that allows organizations to manage the security of all computers across the network, without negatively impacting device performance and at the lowest possible cost of ownership. It provides the following key benefits:

- **Lightweight product**

  All operations are performed in the cloud, with almost no impact on computer performance.

  - **Low memory usage**: the size of the locally stored signature files has been reduced thanks to Panda Security's use of real-time queries to collective intelligence. This has allowed us to move the malware database from the user's computer to the cloud.
  
  - **Low network usage**: the number of required downloads has been reduced to the minimum.
  
  - **Ability to share signature files among endpoints**: signature files are downloaded once and shared across the network.
  
  - **Low processor usage**: the detection intelligence has been moved to the cloud, thereby requiring fewer processor resources on users' computers.
• **Cross-platform security and prevention**

Covers all infection vectors on Windows, Linux, macOS and Android devices.

- **Security for all infection vectors**: web browsing, email, file system and all external devices connected to the PC.
- **Security against unknown threats**: anti-exploit technology to prevent malware from leveraging unknown security flaws in software in order to infect computers.
- **Behavior-based protection**: to detect unknown malware.
- **Cross-platform security**: Windows, Linux, MacOS, Android and virtual engines (VMware, Virtual PC, MS Hyper-V, Citrix).
- **Prevention**: prevent future attacks by editing the settings of the different protection modules and patching the vulnerabilities found in the operating systems and applications installed.

• **Easy to manage**

Easy-to-manage solution which doesn’t require maintenance or additional infrastructure on the customer’s network.

- **Easy to maintain**: no specific infrastructure is required to host the solution, allowing the IT team to spend their time on more productive tasks.
- **Easy protection for remote users**: each computer with **Panda Endpoint Protection / Plus** installed communicates directly with the cloud; roaming users and remote offices are protected quickly and easily without specific installations or VPN configurations.
- **Easy to deploy**: provides multiple deployment methods and automatic uninstallers to remove competitor products and migrate easily from a third-party solution.
- **Soft learning curve**: simple and intuitive Web-based interface. Often-used options are one click away.

### 2.3. Main benefits of Panda Endpoint Protection Plus on Aether.

Email and Internet browsing are the main entry points of malware into organizations, and two key factors that affect employee productivity.

Email is a business-critical tool. However, studies reveal that 95 percent of corporate email is either infected or is spam, making email the most widely used attack vector and one that requires the latest protection technologies.

Additionally, Internet browsing is affected by the most recent threats, such as bots, phishing and malicious active content, capable of attacking users while they browse the Internet and infecting corporate networks.

**Panda Endpoint Protection Plus** allows organizations to easily manage the security of every computer on the corporate network, without negatively impacting device performance and with
low total cost of ownership. **Panda Endpoint Protection Plus** adds the following benefits to those already provided by **Panda Endpoint Protection**:

- **Maximum productivity**

  Monitors and filters Web traffic and spam so that companies can focus on their core business and forget about employees’ unproductive behavior.

  - **Web monitoring and filtering**: increases corporate productivity by tracking users’ Internet activities and preventing access to dangerous or unproductive websites during working hours. Supports any Web browser.
  
  - **No more flooded mailboxes**: reduce the risk of attacks on your Exchange servers with the content filter feature. Improve end-user productivity and protection by filtering unwanted and malicious messages with the anti-malware and anti-spam engines.

### 2.4. Aether Platform: key features

**Aether** is the new management, communication and data processing platform developed by Panda Security, which centralizes the services common to all of the company’s products.

**Aether** Platform manages communication with the agents deployed across the network. Plus, its management console presents the data gathered by **Panda Endpoint Protection / Plus** in the simplest and easiest to understand way for later analysis by the network administrator.

Panda Endpoint Protection / Plus, in turn, has been developed to get the most out of the services delivered by Aether Platform, focusing all efforts on improving customers’ security.

The solution’s modular design eliminates the need for organizations to install new agents or products on customers’ computers for any new module that is purchased. **Panda Endpoint Protection / Plus** has been developed to get the most out of the services delivered by the **Aether** platform, focusing all efforts on improving customers’ security. **Aether**, in turn, manages communication with the agents deployed and the administrator of the solution via the management console, and the presentation and processing of the information collected by **Panda Endpoint Protection / Plus** to be analyzed.

### 2.4.1 Key benefits of Aether

The following are the main services that **Aether** provides for all compatible Panda Security products:

- **Cloud management platform**

  **Aether** is a cloud-based platform from Panda Security, with a series of significant benefits in terms of usage, functionality and accessibility.
- It does not require management servers to host the management console on the customer's premises as it operates from the cloud, it can be accessed directly by all devices subscribed to the service, from anywhere and at any time, regardless of whether they are office-based or on-the-road.

- Network administrators can access the management console at any moment and from anywhere, using any compatible Internet browser from a laptop, desktop or even mobile devices such as tablets or smartphones.

- It is a high-availability platform, operating 99.99% of the time. Network administrators don’t need to design and deploy expensive systems with redundancy to host the management tools.

- **Real-time communication with the platform**

  The pushing out of settings and scheduled tasks to and from network devices is performed in real-time, the moment that administrators apply the new settings to the selected devices. Administrators can adjust the security parameters almost immediately to resolve security breaches or to adapt the security service to the dynamic corporate IT infrastructure.

- **Multi-product and cross-platform**

  The integration of Panda Security products in a single platform offers administrators a series of benefits:

  - **Minimize the learning curve**: all products share the same platform, thereby reducing the time that administrators require to learn how to use the new tool, which in turn reduces the TCO.

  - **Single deployment for multiple products**: only one software program is required on each device to deliver the functionality of all products compatible with Aether Platform. This minimizes the resource consumption on users' devices in comparison with separate products.

  - **Greater synergy between products**: all products report through the same console and on a single platform: administrators have a single dashboard from which they can see all the generated data, reducing the time and effort invested in maintaining several independent information repositories and in consolidating the information into a single format.

  - **Compatible with multiple platforms**: it is no longer necessary to invest in a range of products to cover the whole spectrum of devices used by a company: Aether Platform supports Windows, Linux, macOS and Android.

- **Flexible and granular settings**

  The new configuration model speeds up the management of devices by reusing configurations, taking advantage of specific mechanisms such as inheritance and the assignment of configurations to individual devices. Network administrators can assign more detailed and specific settings with less effort.
Aether Platform implements mechanisms that enable the configuration of the amount of data displayed across a wide range of reports, depending on the needs of the administrator or the end-user of the information.

The product information is completed with data about devices and installed hardware and software, as well as a change log, which helps administrators to accurately determine the security status of the network.

### 2.4.2 Aether Architecture

Aether's architecture is designed to be scalable in order to offer a flexible and efficient service. Information is sent and received in real time to and from numerous sources and destinations simultaneously. These can be endpoints linked to the service, external consumers such as SIEM systems or mail servers, or Web instances for requests for configuration changes and the presentation of information to network administrators.

Moreover, Aether implements a backend and storage layer that implements a wide range of technologies that allow it to efficiently handle numerous types of data.

Figure 1 shows a high-level diagram of Aether Platform.

### 2.4.3 Aether on users' computers

Network computers protected by Panda Endpoint Protection / Plus on Aether have a software program installed, made up of two independent yet related modules, which provide all the protection and management functionality:

- **Panda communications agent module**: this acts as a bridge between the protection module and the cloud, managing communications, events and the security settings implemented by the administrator from the management console.

- **Panda Endpoint Protection / Plus protection module**: this is responsible for providing effective protection for the user’s computer. To do this, it uses a communications agent to receive the configurations and send statistics and detection information and details of the items scanned.

- **Panda real-time communications agent**

The Panda agent handles communication between managed computers and the Panda Endpoint Protection / Plus server. It also establishes a dialog among the computers that belong to the same network in the customer's infrastructure.

This module, besides managing local processes, also gathers the configuration changes made by the administrator through the Web console, and applies them to the Panda Endpoint Protection / Plus protection module.
The communication between the devices and the Command Hub takes place through real-time persistent connections. A connection is established for each computer for the entire data flow. To prevent intermediate devices from closing the connections, a steady flow of keep-alive packets is generated.

The settings configured by the network administrator via the Panda Endpoint Protection / Plus management console are sent to the backend through a REST API. The backend in turn forwards them to the Command Hub, generating a POST command which pushes the information to all managed devices. This information is transmitted instantly provided the communication lines are not congested and every intermediate element is working properly.
2.5. **Panda Endpoint Protection / Plus architecture: key components**

**Panda Endpoint Protection / Plus** is a cloud security service that moves security intelligence and most scanning tasks to the IT infrastructure deployed in Panda Security’s Data Processing Centers. This results in an extremely lightweight security software with low resource usage and low requirements to run in organizations.

Figure 3 shows the general structure of **Panda Endpoint Protection / Plus** and its components:

**Panda Endpoint Protection / Plus** is made up of the following components:

- Collective Intelligence servers
- **Panda Endpoint Protection / Plus** agent installed on the device to protect
- **Panda Endpoint Protection / Plus** protection installed on the device to protect
- Signature file
- Administrator console
Below we describe the roles of each of these components.

### 2.5.1 Collective Intelligence servers

Collective Intelligence has servers that automatically classify and process all the data provided by the user community about the detections made on customers' systems. These servers belong to Panda Security's cloud-based infrastructure. Apart from this, the protection installed on computers queries Collective Intelligence only when required, ensuring maximum detection power without negatively affecting resource consumption.

### 2.5.2 Management console Web server

**Panda Endpoint Protection / Plus** is managed entirely through the Web console accessible to administrators from [https://www.pandacloudsecurity.com/PandaLogin/](https://www.pandacloudsecurity.com/PandaLogin/)

The Web console is compatible with the most popular Internet browsers, and is accessible anytime, anywhere from any device with a supported browser.
Refer to Chapter 4 The management console, to check whether your Internet browser is compatible with the service.

The Web console is responsive, that is, it can be used on smartphones and tablets without any problems.

2.5.3 Computers protected with Panda Endpoint Protection / Plus

Panda Endpoint Protection / Plus requires the installation of a small software component called agent on all computers on the network susceptible of having security problems.

This component is made up of two modules: the Panda Endpoint Protection / Plus communications agent and the protection module.

The protection module contains the technologies designed to protect customers' computers. Panda Endpoint Protection / Plus provides, in a single product, everything necessary to detect targeted and next-generation malware (APTs), as well as remediation tools to disinfect compromised computers and assess the impact of intrusion attempts.

Panda Endpoint Protection / Plus can be installed without problems on computers with competitors' security products installed.

2.5.4 Panda Patch Management service (optional)

This service reduces the attack surface of the Windows workstations and servers in the organization by updating the vulnerable software found (operating systems and third-party applications) with the patches released by the relevant vendors.

Additionally, it finds all programs on the network that have reached their EOL (End-Of-Life) stage. These programs pose a threat as they are no longer supported by the relevant vendor and are a primary target for hackers looking to exploit known unpatched vulnerabilities. With Panda Patch Management, administrators can easily find all EOL programs in the organization and design a strategy for the controlled removal of this type of software.

Also, in the event of compatibility conflicts or malfunction of the patched applications, Panda Patch Management allows organizations to roll back/uninstall those patches that support this feature.

2.6. Panda Endpoint Protection / Plus on Aether: user profile

Even though Panda Endpoint Protection / Plus is a managed service that offers security without intervention from the network administrator, it also provides clear and detailed information about
the malware activity detected across the entire corporate network. This data can be used by administrators to clearly assess the impact of security problems, and adapt the company's protocols to prevent similar situations in the future.

2.7. **Panda Endpoint Protection / Plus on Aether: supported devices and languages**

Refer to Appendix 1: Panda Endpoint Protection / Plus requirements, for a full description of the platforms supported by Panda Endpoint Protection / Plus on Aether and its requirements.

**Panda Endpoint Protection / Plus** supports the following operating systems:

- Windows Workstation
- Windows Server
- Linux
- MacOS
- Android smartphones and tablets

Additionally, the management console supports the following Web browsers:

- Chrome
- Internet Explorer
- Microsoft Edge
- Firefox
- Opera

Finally, the following languages are supported in the management console:

- English
- Spanish
- Swedish
- French
- Italian
- German
- Portuguese
- Hungarian
- Russian
2.8. Available resources and documentation

Below is a list of the available resources for Panda Endpoint Protection / Plus on Aether:

Panda Endpoint Protection / Plus Administration Guide

Product Page

Product Support Page

http://www.pandasecurity.com/uk/support/cloud-office-protection.htm
3. Panda Endpoint Protection / Plus Technologies

Technical resources implemented
Adaptation
3.1. Introduction

In recent years, the use of the Internet and all types of mobile devices has become universal in all fields. Laptops, servers, smartphones, tablets, removable storage drives and numerous other devices are now widely used in corporate environments. The business world has benefited enormously from these changes, increasing productivity and efficiency, and also improving internal and external communication.

At the same time, there have also been significant changes in the malware landscape: from the exponential growth in dangerous items circulating on the Internet to the increasing sophistication with which malware operates. Today, malware aims to go completely unnoticed in order to achieve its goal, which is in almost all cases, financial.

In this scenario, the cloud has become an element of paramount importance: the high number of discovered threats would require enormous resources on the computers to protect, with a huge impact on device performance.

That’s why Panda Security has launched **Panda Endpoint Protection / Plus**, a security product for users’ computers based on Collective Intelligence: an automatic system for detecting and disinfecting malware which is fed with the shared knowledge from millions of users. Thanks to Collective Intelligence, the computers that make up the Panda community instantly share and benefit from all the malware information which is stored and continuously updated in the cloud.

Panda Security was the first company with the infrastructure, the technology, the knowledge and the experience to apply the Collective Intelligence model to its products on the market. This way, Panda Security gives customers maximum protection with minimal impact on endpoints.

This chapter provides an overview of the technologies implemented in **Panda Endpoint Protection / Plus** to manage the security of a company’s network in the aforementioned malware scenario.

3.2. Technical resources implemented in Panda Endpoint Protection / Plus

The aim of **Panda Endpoint Protection / Plus** is to enable the IT Department to create a space where they can define and establish corporate security policies that respond rapidly and adequately to the new types of threats that are continuously emerging. This space is partly the product of the removal of responsibilities from the company’s technical team of deciding which files are safe and which are dangerous, and for what reason. **Panda Endpoint Protection / Plus** detects all kinds of threats automatically, without requiring active intervention from the network administrator or continuous monitoring of the security status of the network, saving time and resources.

On the other hand, the IT Department will also receive a set of tools for viewing the security status of the network and resolving malware-related problems.
With all this information and tools, administrators can completely close the corporate security cycle: monitoring the status of the network, resetting the system to the situation prior to any potential security breach, and being aware of its scope in order to implement appropriate contingency measures. This entire cycle is also in a continuous process of refinement and improvement, resulting in a secure, flexible and productive environment for all the company’s users.

### 3.2.1 Anti-exploit protection

**Panda Endpoint Protection / Plus** implements technologies to protect network computers against threats capable of leveraging vulnerabilities in installed software. These vulnerabilities can be exploited to cause anomalous behaviors in applications, leading to security failures on customers' networks.

Our anti-exploit technology detects and neutralizes malware such as Blackhole or Redkit that exploits zero-day vulnerabilities (in Java, Adobe, MS Office, etc.), before it infects the computer. The key is to use heuristic technologies with powerful detection capabilities. In particular, the new anti-exploit protection provided by **Panda Endpoint Protection / Plus** analyzes how exploits behave instead of their morphology.

**Panda Endpoint Protection / Plus** uses multiple sensors to send Collective Intelligence information about the behavior of those suspicious files that try to exploit 0-day vulnerabilities in order to infect PCs. This information allows Panda Security to keep the proactive technologies included in its products constantly up-to-date (via on-the-fly updates from the cloud).

In short, **Panda Endpoint Protection / Plus** is designed to detect and neutralize this type of malware before it has been identified (and even created), protecting users against new malware variants.

### 3.2.2 Permanent antivirus protection and Collective Intelligence

The permanent antivirus protection is the traditional security module used to defend organizations against the infection vectors most commonly used by hackers. This module leverages Panda Security's locally stored signature file as well as its real-time queries to Collective Intelligence.

In the current context of ever-increasing amounts of malware, cloud-hosted services have proved much more efficient than traditional signature files to successfully combat the enormous amount of threats in circulation. That's why **Panda Endpoint Protection / Plus**'s antivirus protection is primarily based on Collective Intelligence, a cloud-based knowledge platform that exponentially increases detection capabilities.

Collective Intelligence has servers that automatically classify and process all the information provided by the user community about the detections made on their systems. **Panda Endpoint Protection / Plus** queries Collective Intelligence only when required, ensuring maximum detection power without negatively affecting resource consumption.
Whenever a new malware specimen is detected on a computer in the user community, *Panda Endpoint Protection / Plus* sends the relevant information to our Collective Intelligence servers in the cloud, automatically and anonymously. This information is processed by our servers, delivering the solution to all users in the community in real time.

In short, *Panda Endpoint Protection / Plus* leverages Collective Intelligence to increase its detection capabilities without negatively impacting system performance. Now, all knowledge is in the cloud, and thanks to *Panda Endpoint Protection / Plus*, all users can benefit from it.

### 3.2.3 Protection against advanced stealth techniques and macro viruses

In addition to the traditional detection strategy based on comparing the payload of scanned files to its signature files, *Panda Endpoint Protection / Plus* uses several detection engines that scan the behavior of processes locally.

This allows the solution to detect strange behavior in the main scripting engines (Visual Basic Script, JavaScript and Powershell) incorporated into all current Windows systems and used as an extension of the command line. It also allows *Panda Endpoint Protection / Plus* to detect malicious macros embedded in Office files (Word, Excel, PowerPoint, etc.).

Moreover, the service can also detect the latest fileless infection techniques, which inject the virus payload directly into the processes used to exploit system vulnerabilities. These attacks do not write files to the hard disk, so traditional security solutions are less likely to detect them.

Finally, the solution also incorporates traditional heuristic engines and engines to detect malicious files by their static characteristics.

### 3.2.4 Email and Web protection

*Panda Endpoint Protection / Plus* goes beyond the traditional email and Web security approach based on plug-ins that add protection features to certain email clients and Web browsers. Instead, it works by intercepting at low level every communication that uses common protocols such as HTTP, HTTPS or POP3. This way, the solution is able to provide permanent, homogeneous protection for all email and Web applications past, present and future, without the need for specific configurations or updates every time an email or Web service provider releases a new product incompatible with the previous plug-ins.
3.2.5  **Firewall and intrusion detection systems (IDS)**

**Panda Endpoint Protection / Plus** provides three basic tools to filter the network traffic that protected computers send and receive:

- **Protection using system rules**: these rules describe communication characteristics (ports, IP addresses, protocols etc.) in order to allow or deny the data flows that match the configured rules.
- **Program protection**: rules that allow or prevent the programs installed on users’ computers from communicating.
- **Intrusion detection system**: detects and rejects malformed traffic patterns that may affect the security or performance of protected computers.

3.2.6  **Device Control**

Popular devices like USB flash drives, CD/DVD readers, imaging and Bluetooth devices, modems and smartphones can become a gateway for infections.

**Panda Endpoint Protection / Plus** allows administrators to restrict the use of those devices on protected computers, blocking access to them or allowing complete or partial use only (read-only access).

3.2.7  **Spam, virus and content filtering for Exchange servers**

**Feature only available in Panda Endpoint Protection Plus.**

**Panda Endpoint Protection / Plus** scans Exchange servers for viruses, hacking tools and suspicious/potentially unwanted programs directed to users’ mailboxes.

Apart from that, eliminating junk mail (spam) is a time-consuming task. And not only that, spam is also a frequent source of scams. To tackle this, **Panda Endpoint Protection / Plus** provides anti-spam protection for Exchange servers. This feature helps companies improve user productivity and increase the security of network computers.

**Panda Endpoint Protection / Plus** protects Exchange email servers by using two different technologies:

- **Mailbox protection**

This protection is used on Exchange servers with the Mailbox role, and scans folders/mailboxes in the background or when messages are received and stored in users’ folders.
The mailbox protection allows manipulation of the items contained in the body of scanned messages. Thus, the protection can replace any dangerous item found with a clean one, move dangerous items to quarantine, etc.

Additionally, the mailbox protection allows administrators to scan Exchange server users' folders in the background, making the most of server idle times. This protection uses smart scans to avoid re-scanning already scanned items, as opposed to the typical scenario where both the mailboxes and the quarantine folder are scanned every time a new signature file is published.

- **Transport protection**

  This protection is used on Exchange servers with the Client Access, Edge Transport and Mailbox roles, and scans the traffic that goes through the Exchange server.

  This protection does not allow manipulation of the items contained in the body of scanned messages. That is, the body of dangerous messages is treated as a single component, and every action taken by Panda Endpoint Protection / Plus affects the entire message: delete the message, quarantine it, let it through without taking any action, etc.

### 3.2.8 Web access control

Panda Endpoint Protection / Plus divides websites into 64 categories, enabling network administrators to restrict access to them and to any manually entered URL. This protection helps organizations optimize network bandwidth usage and employee productivity, restricting access to non-business related Web resources.

Additionally, Panda Endpoint Protection / Plus allows administrators to set time restrictions to limit access to certain Web page categories and blacklisted sites during working hours, or authorize it during non-business hours or weekends.

### 3.2.9 Network status visibility

Panda Endpoint Protection / Plus provides a number of resources that allow administrators to assess the security status of their corporate network at a glance, using the activity panels displayed in the solution's dashboard.

The Panda Endpoint Protection / Plus dashboard provides key information about the detections made in the different infection vectors used by malware.
3.2.10 Disinfection techniques
In the event of a security breach, the administrator must be able to quickly restore the affected computers to their original state.

To make that possible, Panda Endpoint Protection / Plus provides advanced disinfection tools along with a quarantine to store suspicious and deleted items.

3.2.11 Vulnerability patching (Panda Patch Management)
Panda Patch Management keeps a database of the patches and updates released by software vendors for the Windows operating systems installed on customers' networks. The service compares this database to the actual patches installed across each customer's organization and identifies computers with vulnerable software. These computers are susceptible to malicious attacks aimed at infecting the corporate network.

To tackle this threat, Panda Patch Management allows administrators to create quick and scheduled patching tasks and push them to the computers in their organization, thus reducing the attack surface of workstations and servers.

3.3. Adaptation phase
After resolving a security incident with the Remediation tools, the administrator will have to adjust the company's security policies to prevent any such situation from occurring again.

Panda Endpoint Protection / Plus can be used to strengthen endpoint security in a number of ways:

- Changing the antivirus protection settings

Scheduling a larger number of scans or enabling the protection against infection vectors such as email or the Internet will help protect computers.
• Restricting access to certain websites by category

Reconfiguring the categories of website content accessible to users will reduce the number of dubious sites, ad-ridden pages, and innocent-looking but dangerous download portals (ebooks, pirated software, etc.) that may infect users' computers.

• Filtering out spam and phishing messages

Email is an infection vector commonly used by phishing attacks. Adjusting the settings of the content filtering and anti-spam features will reduce the number of unsolicited messages received at users' mailboxes, reducing the attack surface.

• Partially or completely preventing access to pen drives and other external devices

Another commonly-used infection vector is the USB drives and modems that users bring from home. Limiting or completely preventing access to these devices will block malware infections through these means.

• Using the firewall and the intrusion detection system (IDS) to restrict communications from and to installed programs

The firewall is a tool designed to minimize exposure to threats, by preventing communications to and from programs that are not malicious in nature but may leave the door open for malware to enter the network. If malware is detected that has infected the network via a chat or P2P application, configuring the firewall rules correctly can prevent those programs from communicating with the exterior world.

The firewall and the IDS can also be used to prevent malware from propagating once the first computer has been infected.

• Changing the Panda Patch Management settings

Changing the settings of patching tasks will let you minimize the time during which your programs remain vulnerable to attacks looking to exploit security holes. Also, installing more different types of
patches will improve the security of the network, ensuring that all your software incorporates the latest updates released by the relevant vendors.

Additionally, uninstalling or updating the programs that have reached their EOL (End-Of-Life) stage will minimize the attack surface of your computers, as all software that does not receive updates will be removed. This software is more likely to have unpatched vulnerabilities that could be exploited by malware.
4. The management console

Characteristics
Structure
4.1. Introduction

The Web console is the main tool with which administrators can manage security. As it is a centralized Web service, it brings together a series of features that benefit the way the IT department operates.

- **A single tool for complete security management**
  The Web management console lets administrators deploy the Panda Endpoint Protection / Plus software to all computers on the network, configure their security settings, monitor the protection status of the network, and benefit from remediation tools to resolve problems. All these functions are available from a single console, facilitating integration of different tools and minimizing the complexity of using products from different vendors.

- **Centralized security management for all offices and mobile users**
  The Web console is hosted in the cloud so it is not necessary to install new infrastructure on customers’ premises, configure VPNs or change router settings. Neither is it necessary to invest in hardware, operating system licenses or databases, nor to manage licenses and warranties to ensure the operativity of the service.

- **Service management from anywhere at anytime**
  The Web management console is responsive, adapting to any device used to manage security. This means administrators can manage security from any place and at any time, using a smartphone, a notebook, a desktop PC, etc.

4.1.1 Web console requirements

The Web console can be accessed from the following link:

[https://www.pandacloudsecurity.com/PandaLogin/](https://www.pandacloudsecurity.com/PandaLogin/)

The following requirements are necessary to access the Web management console:

- You must have valid login credentials (username and password).

Refer to Appendix 2: creating and managing a Panda Account for more information about how to create a Panda account for accessing the Web console.

- A certified supported browser
- Internet connection and communication through port 443
4.1.2 IDP federation

Panda Endpoint Protection / Plus delegates credential management to an identity provider (IDP), a centralized application responsible for managing user identity.

This means that with a single Panda Account the network administrator will have secure and simple access to all contracted Panda products.

4.2. General characteristics of the console

Panda Endpoint Protection / Plus’s management console allows administrators to interact with the service, and provides the following benefits:

- **Responsive/adaptive design**: the Web console adapts to the size of the screen or Web browser the administrator is viewing it with, dynamically hiding and showing items as required.
- **Prevents page reloads**: the console uses Ajax technologies for easy navigation through lists, avoiding full page reloads.
- **Flexibility**: its interface adapts easily to the administrator’s needs, allowing them to save settings for subsequent accesses.
- **Homogeneity**: the resources implemented in the management console follow clearly-defined usability patterns to lower the administrator’s learning curve.
- **List export tools**: all lists can be exported to CSV format with extended fields for later consultation.

4.3. General structure of the Web management console

![Figure 4: overview of the Panda Endpoint Protection / Plus management console](image)

Figure 4: overview of the Panda Endpoint Protection / Plus management console
The Web management console has resources that ensure a straightforward and smooth management experience, both with respect to security management as well as remediation tasks.

The aim is to deliver a simple yet flexible and powerful tool that allows administrators to begin to productively manage network security as soon as possible.

Below is a description of the items available in the console and how to use them.

### 4.3.1 Top menu (1)

The top menu allows you to access each of the seven main areas that the console is divided into:

- Panda Cloud button
- Status
- Computers
- Settings
- Tasks
- General settings
- User account

**Panda Cloud button**

Click the button you'll find on the left corner of the top menu. You’ll access a section from which you will be able to access every Panda Security product you have contracted, as well as edit your Panda Account settings.

**Status menu**

The **Status** menu at the top of the console displays the dashboard, which provides administrators with an overview of the security status of the network through widgets and a number of lists accessible through the side menu.

> Refer to chapter 7 Managing computers and devices for more information.

**Computers menu**

The **Computers** menu provides the basic tools for network administrators to define the computer structure that best adapts to the security needs of their IT network.

Choosing the right device structure is essential in order to assign security settings quickly and easily.
Settings menu

Lets you define different types of settings:

- **Users**: lets you manage the users that will be able to access the management console, and the actions they can take.

- **Per-computer settings**: lets you configure the Panda Endpoint Protection / Plus software updates and its administration password.

- **Proxy and language**: lets you configure the way computers connect to the Internet and the language of the Panda Endpoint Protection / Plus software.

- **Workstations and servers**: lets you create the configuration profiles to assign to the devices displayed in the Computers menu.

Tasks menu

Lets you schedule security tasks to be run on the day and time specified by the administrator.

General Settings menu

Displays a drop-down menu that allows the administrator to change the console language and access the following resources:
- **Advanced Administration Guide**

- **Technical Support:** takes you to the Technical Support Web page for Panda Endpoint Protection / Plus on Aether.

- **Suggestion box:** launches the mail client installed on the computer to send an email to Panda Security's technical support department.

- **License Agreement:** displays the product's EULA (End User License Agreement).

- **Language:** lets you change the language of the console.

- **About...:** displays the version of the different elements that make up Panda Endpoint Protection / Plus.
  - **Version:** product version.
  - **Protection version:** internal version of the protection module installed on computers.
  - **Agent version:** internal version of the communications module installed on computers.

**User Account menu**

Displays a drop-down menu with the following setting options:

- **Set up my profile:** lets you change the information of the product's main account.

- **Change account:** lists all the accounts that are accessible to the administrator and lets you select an account to work with.

- **Log out:** lets you log out of the management console and takes you back to the IDP screen.

4.3.2 **Side menu (2)**

The side menu lets you access different subareas within the selected area. It acts as a second-level selector with respect to the top menu.

The side menu will change depending on the area you are in, adapting its contents to the information required.

4.3.3 **Widgets (3)**

The widgets are graphical representations of data. They allow administrators to view at a glance the available information regarding a certain aspect of network security. Hover the widgets to display tooltips with additional information. Click the widgets to show additional details.

Refer to chapter 15 Malware and network visibility for more information.

4.3.4 **Tab menu**

The most complex areas of the console provide a third-level selector in the form of tabs that present the information in an ordered manner.
To facilitate navigating the console and performing some common operations on your managed workstations and servers, an action bar has been added at the top of every list that contains checkboxes to select computers.

The number of buttons on the action bar will vary depending on the size of the window. Click the icon at the right end of the action bar to view those buttons that don't fit within the allocated space.

Finally, take a look at the far right-hand corner of the action bar to see the total number of selected computers. Click the cross icon to undo your selection.

**4.3.6 Filtering and search tools**

The filtering and search tools allow administrators to filter and display information of special interest.

Some filtering tools are generic and apply to the entire screen, for example in the Status and Computers menus.

However, there are other more complete tools accessible through the Filters button, which allow you to refine your searches according to categories, ranges and other parameters based on the information displayed.
The **Panda Endpoint Protection / Plus** Web console uses standard settings elements, such as:

---

**4.3.7 Settings elements (8)**

**General**

**Advanced protection (Windows computers)**

The advanced protection tracks the activity of every program run on your computers, immediately detecting and blocking malicious programs. Additionally, it acts against any suspicious or potentially dangerous item in record time thanks to the direct monitoring of Panda Security's lab technicians.

4.3.8 Context menus

These are drop-down menus that appear when the user clicks the icon. They display options relevant to the area they are in.

![Context menu](image)

4.3.9 Lists

The lists display information in tables along with tools to help with navigation.

- Listname (1): lets you identify the information on the list.
- Filtering and search tool link (2): click it to display a panel with search and filtering controls.
- Context menu (3): displays a drop-down menu with export options.
- Filtering and search parameters (4): let you refine the data displayed on the list.
- Sort order (5): you can change the sort order of the list by clicking the column headers at the top of the list view. Click the same header a second time to switch between ascending and descending order. This is indicated with arrows ( for ascending and for descending). If you are accessing the management console from a small-size mobile device, click the icon in the bottom-right corner of the screen to display a menu with the names of the columns included in the table.
- Pagination (6): at the bottom of the table there are pagination tools to help you navigate easier and faster.
  - Rows per page selector (7)
  - Number of pages/rows displayed out of the total number of pages/rows (8)
  - First page link (9)
  - Previous page link (10)
- Links to the next 5 pages (11)
- Next page link (12)

5. Licenses

Definitions and key concepts
- Contracted licenses
- Expired licenses
- Trial licenses

Computer search based on license status
5.1. Introduction

To benefit from Panda Endpoint Protection / Plus's advanced security services you need to purchase licenses of the product and assign them to the computers to protect, according to your organization's security needs.

This chapter explains how to manage your Panda Endpoint Protection / Plus licenses, as well as how to assign them to your computers, release them and check their status.

To start using the Panda Endpoint Protection / Plus service, you must purchase a number of licenses equal to or greater than the number of computers to protect. Each Panda Endpoint Protection / Plus license is assigned to a single computer (workstation, server or mobile device).

To purchase and/or renew licenses, contact your designated partner.

5.2. Definitions and key concepts for managing licenses

The following is a description of terms required to understand the graphs and data provided by Panda Endpoint Protection / Plus to show the status of computer licenses.

5.2.1 License contracts

Licenses are grouped into license contracts. A license contract is a group of licenses with certain similar characteristics, as follows:

- **Product type**: Panda Endpoint Protection / Plus.
- **Contracted licenses**: number of licenses contracted in the license contract.
- **License type**: NFR, Trial, Commercial, Subscription.
- **Expiry**: license expiry date and the computers that will cease to be protected.

5.2.2 Computer status

Panda Endpoint Protection / Plus makes a distinction between three different license statuses on network computers:

- **Computers with a license**: the computer has a valid license in use.
- **Computers without a license**: the computer doesn’t have a valid license in use but is eligible to have one.
- **Excluded**: computers for which it has been decided not to assign a license. These computers won’t be protected by Panda Endpoint Protection / Plus, although they will be displayed in the console and some management features will be valid for them. To exclude a computer, you have to release the license manually.
5.2.3 License status and groups

There are two possible status types for contracted licenses:

- **Assigned**: this is a license used by a network computer.
- **Unassigned**: this is a license that is not being used by any computer on the network.

Licenses are separated into two groups according to their status:

- **Used license group**: comprising all licenses assigned to computers.
- **Unused license group**: comprising the licenses that are not assigned.

5.2.4 Types of licenses

- **Commercial licenses**: these are the standard *Panda Endpoint Protection / Plus* licenses. A computer with an assigned commercial license benefits from the complete functionality of the product.
- **Trial licenses**: these licenses are free and valid for thirty days. A computer that has a trial license assigned has temporary access to all product features.
- **NFR licenses**: not For Resale licenses are for Panda Security partners and personnel. It is not permitted to sell these licenses, nor for them to be used by anyone other than Panda Security partners or personnel.
- **Subscription licenses**: these are licenses that have no expiry date. This is a “pay-as-you-go” type service.

5.2.5 License management

Licenses can be assigned in two ways: manually and automatically.

**Automatic assignment of licenses**

Once you install *Panda Endpoint Protection / Plus* on a computer on the network, and provided there are unused *Panda Endpoint Protection / Plus* licenses, the system will assign a free license to the computer automatically.

**Manual assignment of licenses**

Follow the steps below to manually assign a *Panda Endpoint Protection / Plus* license to a network computer.

- Go to the **Computers** menu at the top of the console. Find the device to assign the license to. You can use the folder tree, the filter tree or the search tool.
- Click the computer to access its details screen.
Go to the Details tab. The Licenses section will display the status 'No licenses'. Click the icon to assign a free license to the computer automatically.

5.2.6 License release

Just as with the license assignment process, you can release licenses in two ways: manually and automatically.

Automatic release

When the Panda Endpoint Protection / Plus software is uninstalled from a network computer, the system automatically recovers a license and returns it to the group of licenses available for use.

Similarly, when a license contract expires, licenses will automatically be unassigned from computers in accordance with the expired license process explained later in this chapter.

Manual release

Manual release of a license previously assigned to a computer will mean that the computer becomes 'excluded'. As such, even though there are licenses available, they will not be assigned automatically to this computer.

Follow the steps below to manually release a Panda Endpoint Protection / Plus license:

- Go to the Computers menu at the top of the console. Find the device whose license you want to release. You can use the folder tree, the filter tree or the search tool.
- Click the computer to access its details screen.
- Go to the Details tab. The Licenses section will display the status 'Panda Endpoint Protection / Plus'. Click the icon to release the license and send it back to your group of unused licenses.

5.2.7 Processes for assigning and releasing licenses

Case 1: excluded computers and those with assigned licenses

By default, each new computer on the Aether platform is assigned a Panda Endpoint Protection / Plus product license automatically, and as such acquires the status of a computer with an assigned license. This process continues until the number of available licenses reaches zero.

Computers whose assigned licenses are released manually acquire the status of 'excluded', and are no longer in the queue for automatically assigned licenses if they are available.
Figure 12: modification of license groups with excluded computers and those with licenses assigned

Case 2: computers without an assigned license

As new computers are included on the Aether platform and the group of unused licenses reaches zero, these computers will have the status of computers without a license. As new licenses become available, these computers will automatically be assigned a license.

Similarly, when an assigned license expires, the computer will have the 'without license' status in accordance with the expired license process explained later in this chapter.

5.3. Contracted licenses

To see details of contracted licenses, click the **Status** menu and then **Licenses** in the side menu. You will see a window with two graphs: **contracted licenses** and **License expiry**.

Figure 13: computers without an assigned license due to expiry of the license contract and because the group of unused licenses is empty.
5.3.1 Widget

The panel shows how the contracted product licenses are distributed.

**Figure 14: license panel with three license contracts**

- Name of the contracted product (1)
- Total number of licenses contracted (2)
- Number of licenses assigned (3)
- Number of licenses not assigned (4)
- Number of computers without license (5)
- Number of excluded computers (6)
- License expiry (7)
- License contract expiry (8)

**Name of the contracted product (1)**

This specifies the products and services contracted. Each different product is shown separately. If the same product has been contracted several times (several license contracts of one product) they will be shown together, indicating the different expiry dates of the licenses in a horizontal bar chart.

**Total number of contracted licenses (2)**

This represents the maximum number of computers that can be protected if all the contracted licenses are assigned.

**Assigned (3)**

This is the number of computers protected with an assigned license.
**Unassigned (4)**
This is the number of licenses contracted that haven’t been assigned to a computer and are therefore not being used.

**Computers without a license (5)**
Computers that are not protected as there are insufficient licenses. Licenses will be assigned automatically once they are bought.

**Excluded computers (6)**
Computers without a license assigned and that are not eligible to have a license.

**License expiry (7)**
If there is only one license contract, all licenses expire at the same time, on the specified date.

**License contract expiry (8)**
If one product has been contracted several times over a period of time, a horizontal bar chart is displayed with the licenses associated to each contract/license contract and the separate expiry dates.

### 5.3.2 License list
This list shows details of the license status of network computers, with filters that help you locate desktop or mobile devices according to their license status.

**Platform** | Operating system installed. All Windows Linux MacOS Android |

**License status** | Assigned No license Excluded |

Table 3: filter fields for the Licenses list

### Lists accessible from the panel

100 contracted licenses

- **1** Assigned (9)
- **9** Unassigned (9)
- **2** Computers with no license (2)
- **3** Excluded (1)

Figure 15: hotspots in the Contracted licenses panel

The lists accessible from the panel will display different information based on the hotspot clicked:

- **(1)** Filter by `license status` = Assigned
- **(2)** Filter by `license status` = Unassigned
- **(3)** Filter by `license status` = Excluded
5.4. Expired licenses

Apart from subscription license contracts, all other licenses have an expiry date, after which the computers will cease to be protected.

5.4.1 Expiry notifications

Thirty days before a license contract expires, the Contracted licenses panel will display a message showing the days remaining and the number of licenses that will be affected.

In addition, a message is displayed for each expired license contract, with 30 days warning of the number of licenses that will no longer be valid.

⚠️ If all products and license contracts are expired, you will no longer have access to the management console.

5.4.2 Withdrawal of expired licenses

Panda Endpoint Protection / Plus does not maintain a strict connection between license contracts and computers. Computers with licenses assigned do not belong to a particular license contract. Instead, all licenses from all license contracts are added to a single group of available licenses, which are then distributed among the computers on the network.

Whenever a license contract expires, the number of licenses assigned to that contract is determined and the computers with licenses assigned are arranged according to the Last connection field, which indicates the date the computer last connected to the Panda Security cloud.

Computers whose licenses may be withdrawn will be those that have not been seen for the longest period of time. This establishes a system of priorities whereby it is more likely to withdraw a license from computers that have not been used recently.

ℹ️ This logic for withdrawing expired licenses affects all compatible devices with Panda Endpoint Protection / Plus and with licenses assigned.

5.5. Adding Trial licenses to Commercial licenses

Where a customer has commercial licenses of Panda Endpoint Protection, Panda Endpoint Protection Plus or Fusion on the Aether platform and they get a trial license of Panda Endpoint Protection / Plus, there will be a series of changes, both to the management console and to the software installed on network computers:
- A new trial license contract is created for the trial period and with the same amount of licenses as previously available and the licenses contracted for the trial.

- Commercial license contracts appear temporarily disabled during the trial period, though the expiry and renewal cycle is unaffected.

- The corresponding product functionality is enabled for the trial with no need to update the computers.

- **Panda Endpoint Protection / Plus** will, by default, be enabled in Audit mode. If you do not want to enable **Panda Endpoint Protection / Plus** on all computers or you want to set a different protection mode, this can be configured accordingly.

Once the trial period has ended, the license contract created for the trial will be deleted, the commercial license contract will be reactivated, and the network computers will be downgraded automatically, returning to the previous settings.

### 5.6. Searching for computers based on the status of their licenses

**Panda Endpoint Protection / Plus**’s filter tree lets you search for computers based on the status of their licenses.

Refer to chapter 7 Managing computers and devices for more information about how to create a **Panda Endpoint Protection / Plus** filter.

The properties of the **License** category are as follows:

- **Property - License status**: you can create filters based on the following license status:
  - **Assigned**: lists those computers with a **Panda Endpoint Protection / Plus** license assigned.
  - **Not assigned**: lists those computers that don't have a **Panda Endpoint Protection / Plus** license assigned.
  - **Unassigned manually**: lists those computers whose **Panda Endpoint Protection / Plus** license was released by the network administrator.
  - **Unassigned automatically**: lists those computers whose **Panda Endpoint Protection / Plus** license was automatically released by the system.

- **Property - License name**: finds every computer with a **Panda Endpoint Protection / Plus** license assigned.

- **Property - Type**: lists those computers with a specific type of **Panda Endpoint Protection / Plus** license.
  - **Release**: lists computers with commercial licenses of **Panda Endpoint Protection / Plus**.
  - **Trial**: lists computers with trial licenses of **Panda Endpoint Protection / Plus**.
6. Installing the Panda Endpoint Protection / Plus software

Protection deployment overview
Installation requirements
Manual installation
Discovery and remote installation
Installation with centralized tools
Software uninstall
6.1. Introduction

The installation process deploys **Panda Endpoint Protection / Plus** to all computers on the customer's network. All the software required to enable the advanced protection service and monitor the security status of the network is found in the installation package: there is no need to install any other program on the customer's network.

It is important to install the **Panda Endpoint Protection / Plus** software on every computer on the network to prevent security breaches that may be later exploited by attackers through malware designed to attack vulnerable systems.

**Panda Endpoint Protection / Plus** provides several tools to help administrators install the protection. These tools are discussed later in this chapter.

6.2. Protection deployment overview

The installation process comprises a series of steps that will vary depending on the status of the network at the time of deploying the software and the number of computers to protect. To deploy the protection successfully it is necessary to plan the process carefully, bearing the following aspects in mind:

**Identify the unprotected devices on the network**

The administrator must find those computers on the network without protection installed or with a third-party security product that needs replacing or complementing with **Panda Endpoint Protection / Plus**.

Once identified, the administrator must check to see if they have purchased enough licenses.

**Check if the minimum requirements for the target platform are met**

The minimum requirements for each operating system are described later in this chapter.

**Select the installation procedure**

The installation procedure will depend on the total number of Windows computers to protect, the workstations and servers with a Panda agent installed, and the company's network architecture. Four options are available:
- Centralized distribution tool
- Manual installation using the **Send URL by email** option
- Placing an installer in a shared folder accessible to all users on the network
- Remote installation from the management console

**Determine whether a restart will be necessary to finish the installation process**

Computers with no protection installed won't need to be rebooted to install the protection services provided by **Panda Endpoint Protection / Plus**.

> With older versions of Citrix it may be necessary to restart the computer or there may be a micro-interruption of the connection.

If you want to install **Panda Endpoint Protection / Plus** on a computer that already has an antivirus solution from another vendor, you can choose between installing the solution without uninstalling the current protection so that both products coexist on the computer, or uninstall the other solution and work exclusively with **Panda Endpoint Protection / Plus**.

> To finish removing a third-party antivirus it may be necessary to restart the computer.

The default behavior will vary depending on the **Panda Endpoint Protection / Plus** version to install.

- **Trial versions**

By default, you can install a trial version of **Panda Endpoint Protection / Plus** without removing any other pre-existing third-party solution. This allows organizations to evaluate **Panda Endpoint Protection / Plus** and see for themselves how it detects advanced threats that their traditional antivirus cannot detect.

- **Commercial versions**

By default, it is not possible to install a commercial version of **Panda Endpoint Protection / Plus** on a computer with a solution from another vendor. If **Panda Endpoint Protection / Plus** has the uninstaller to uninstall the other vendor's product, it will uninstall it and then install **Panda Endpoint Protection / Plus**. Otherwise, the installation process will stop.

> Refer to Appendix 3: list of uninstallers for a list of the antivirus solutions that Panda Endpoint Protection / Plus uninstalls automatically. If the solution that needs to be removed is not on the list, it will have to be removed manually.
This behavior can be changed both for trial and commercial versions. Go to Settings, and define a configuration for workstation and servers that has the Uninstall other security products option enabled.

Refer to chapter 10 Security settings for workstations and servers for more information about how to define a security configuration. Refer to chapter 8 Managing settings for more information about how to assign settings to computers.

- **Panda Security antivirus products**

If the computer is already protected with Panda Endpoint Protection, Panda Endpoint Protection Plus or Panda Fusion, the system will automatically uninstall the communications agent to install the Panda agent, and then will check to see if a protection upgrade is required. If it is required, the computer will be restarted.

If the computer is already protected with AdminSecure (Panda Security for Business), the behavior will be the same as with a competitor antivirus.

Table 4 summarizes the necessary conditions for a computer restart.

<table>
<thead>
<tr>
<th>Previous product</th>
<th>Panda Endpoint Protection / Plus on Aether</th>
<th>Restart</th>
</tr>
</thead>
<tbody>
<tr>

<td>Trial version</td>
<td>NO (By default, both products will coexist)</td>
</tr>
<tr>
<td><em>Third-party antivirus and AdminSecure</em></td>
<td>Commercial version</td>
<td>LIKELY (A restart may be necessary to finish uninstalling the third-party product)</td>
</tr>
<tr>
<td><em>Citrix systems</em></td>
<td>Trial or commercial version</td>
<td>LIKELY (with older versions)</td>
</tr>
</tbody>
</table>

Table 4: probability of a restart when installing Panda Endpoint Protection / Plus on Aether
Determine whether it will be necessary to install the protection during non-working hours
In addition to the restart considerations covered before, installing Panda Endpoint Protection / Plus causes a micro-interruption (less than 4 seconds) in the connections established by the programs running on the computer. Any applications that do not incorporate security mechanisms to detect connection interruptions will need a restart. If a restart is not possible and there is the possibility that some applications may not work properly after the micro-interruption, it is advisable to install the Panda Endpoint Protection / Plus software outside office hours.

Determine the computers' default settings
So that Panda Endpoint Protection / Plus can protect the computers on the network from the outset, it forces administrators to select both the target group that the computers to protect will integrate into, and the relevant proxy and language settings. This must be selected upon generating the installer. Refer to section Downloading the Panda Endpoint Protection / Plus software for more information.

Once the software has been installed on a computer, Panda Endpoint Protection / Plus will apply to it the settings configured for the group that the computer is integrated into. If the proxy and language settings for the selected group are different from those specified when generating the installer, the installer settings will prevail.

6.3. Installation requirements

For a full description of the necessary requirements for each platform, refer to Appendix 1: Panda Endpoint Protection / Plus requirements.

6.3.1 Requirements for each supported platform

Windows platforms
- **Workstations**: Windows XP SP3 and later, Windows Vista, Windows 7, Windows 8 and later, and Windows 10.
- **Exchange servers**: from 2003 to 2016.
- **Free space for installation**: 650 MB.
- **Updated root certificates** in order to use the Panda Patch Management module and establish real-time communications with the management console.

macOS platforms
- **Operating systems**: macOS 10.10 Yosemite and later.
- **Free space for installation**: 400 MB.
- **Ports** 3127, 3128, 3129 and 8310 must be accessible for the Web anti-malware and URL filtering to work.

### Linux platforms

- **64-bit operating systems**: Ubuntu 14.04 LTS and later, Fedora 23 and later.
- **Supported kernel**: up to version 4.10 (64-bit).
- **Free space for installation**: 100 MB.
- **Ports** 3127, 3128, 3129 and 8310 must be accessible for the Web anti-malware and URL filtering to work.

### Android platforms

- **Operating systems**: android 4.0 and later.
- **Free space for installation**: 10 MB (depending on the model, it is possible that the required space be larger).

Refer to our support website for more information about the last Linux kernel version supported by Panda Endpoint Protection / Plus. Any later version won’t be supported.

### 6.3.2 Network requirements

**Panda Endpoint Protection / Plus** accesses multiple Internet-hosted resources. In general, it requires access to ports 80 and 443. For a complete list of all the URLs that computers with the **Panda Endpoint Protection / Plus** software installed need to access, refer to Appendix 1: Panda Endpoint Protection / Plus requirements.

### 6.4 Manually downloading and installing the Panda Endpoint Protection / Plus software

#### 6.4.1 Downloading the installation package from the Web console

This consists of downloading the installation package directly from the management console. To do this, follow the steps below:

- Go to the **Computers** menu, click **Add computers**, and select the platform to protect: Windows, Linux, Android or macOS (Figure 16).
- Select the group that the computer will integrate into (Figure 17):
• To integrate the computer into a native group, click **Add computers to this group (1)** and select a destination in the folder tree displayed.

• To integrate the computer into an Active Directory group, click **Add computers to their Active Directory path (2)**.

  Next, you must select the proxy and language settings (3) to apply to the computer. If the computer is to be integrated into a native group, it will automatically inherit the settings of the folder where it will reside. However, if you choose to integrate it into an Active Directory group, you'll have to manually select the proxy and language settings from those displayed in the drop-down menu. If the automatic selection does not meet your needs, click the drop-down menu and select one of the available options.

**Add computers**

To view and manage your computers, install the Panda agent on each one.

Windows  macOS  Linux  Android

Figure 16: platform selection window

• Finally, click **Download installer (5)** to download the relevant installation package. The installer displays a wizard that will guide you through the steps to install the software.

  Figure 17: configuring the download package

**6.4.2 Generating a download URL**

This option allows you to generate a download URL and send it to the targeted users to launch the installation manually from each computer.

The method used to send users the download URL is via email. To do this, click the **Send URL by email (3)** button.
Just as when downloading the installer from the Web console, you’ll have to select the group in the group tree that the computer to protect will integrate into, as well as its proxy and language settings. These settings will take precedence over the group settings.

End users will automatically receive an email with the download link for their operating system. Clicking the link will download the installer.

### 6.4.3 Manually installing the Panda Endpoint Protection / Plus software

**Administrator permission is required to install the Panda Endpoint Protection / Plus software on users’ computers.**

#### Installing Panda Endpoint Protection / Plus on Windows, Linux and macOS platforms

Run the downloaded installer and follow the installation wizard. The product will then verify that it has the latest version of the signature file and the protection engine. If it does not, it will update automatically.

#### Installing Panda Endpoint Protection / Plus on Android platforms

Click Add computer in the Computers menu and select the Android icon to display the information below:

![Figure 18: platform selection screen](image)

- **Add computers to this group (1):** this lets you specify the group within the folder tree to which the device will be added once the Panda Endpoint Protection / Plus software is installed.
- **QR code (2):** the QR code that contains the link to download the software from Google Play.

---

63
To install the software on the user’s device, follow the steps below:

- Select the group within the folder tree in which the device will be added. The QR code will be updated automatically.
- Download the Android app following one of the three methods described below:
  
  - **Via QR code:** click the QR code to expand it. Aim the device camera at the screen, and scan it using a QR-code application. The device screen will display a Google Play URL to download the app. Click the URL.
  
  - **Via email:** click the Send URL by email link to generate an email with the link for the user. The user has to select the link that points to the app download in Google Play.
  
  - **Via the management console:** if you have accessed the management console from the device, click Go to Google Play. You will see the link that points to the app download.

- Once the app is installed, users will be prompted to accept the granting of administrator permissions for the app. Depending on the version of Android (6.0 and later), these permissions will be presented progressively as required or, on the contrary, a single window will be displayed the first time the app is run, requesting all the necessary permissions just once.

Once the process is complete, the device will appear in the group selected in the folder tree.

### 6.5. Automatic computer discovery and remote installation

All products based on Aether Platform provide tools to find the unprotected workstations and servers on your network and launch a remote, unattended installation from the management console.

Remote installation is only compatible with Windows platforms.

#### 6.5.1 Requirements for installing Panda Endpoint Protection / Plus

For you to be able to install Panda Endpoint Protection / Plus remotely, the following requirements must be met:
- UDP ports 21226 and 137 must be accessible to the System process.
- TCP port 445 must be accessible to the System process.
- NetBIOS over TCP must be enabled.
- DNS queries must be allowed.
- Access to the ADMIN$ administrative share must be allowed. This feature must be explicitly enabled on Windows 'Home' editions.
- You must have domain administrator credentials or credentials for the local admin account created by default when installing the operating system.
- Windows Remote Management must be enabled.

To make sure your network computers meet these requirements without needing to manually add rules in the Windows firewall, select Turn on network discovery and Turn on file and printer sharing in Network and Sharing Center, Advanced sharing settings.

### 6.5.2 Computer discovery

Computers are discovered by means of another computer with the role of ‘Discovery computer’. All computers that meet the aforementioned requirements are susceptible to appear on the list of discovered computers, regardless of whether their operating system or device type supports the installation of **Panda Endpoint Protection / Plus**.

The first Windows computer that is integrated into **Panda Endpoint Protection / Plus** will be automatically designated as discovery computer.

#### Requirements for finding unprotected computers on your network

The list of discovered computers displays all workstations and servers that meet the following requirements:

- Have not been hidden by the administrator
- Are not currently managed by **Panda Endpoint Protection / Plus on Aether Platform**
- Are located on the same subnet segment as the discovery computer

All computers that meet the aforementioned requirements will appear on the list of discovered computers, regardless of whether their operating system or device type supports the installation of **Panda Endpoint Protection / Plus**

#### Assigning the role of 'Discovery computer' to a computer on your network

- Make sure the discovery computer has **Panda Endpoint Protection / Plus** installed.
- Click the **Settings** menu at the top of the console. Then, click **Network settings** from the side menu and click the **Discovery** tab.
- Click the **Add discovery computer** button, and select the computer(s) that you want to perform discovery tasks across the network.
Characteristics of a discovery computer

Once you have designated a computer on your network as discovery computer, it will be displayed on the list of discovery computers (top menu Settings, side menu Network settings, Discovery tab). The following information is displayed for each discovery computer:

- **Computer name**
  - **Discovery task settings**: settings of the automatic discovery task scheduled to find unmanaged computers on the network, if there is one.
  - **Last checked**: time and date when the last discovery task was launched.
  - **The computer is turned off or offline**: Panda Endpoint Protection / Plus cannot connect to the discovery computer.
  - **Configure**: lets you define the task scope and type (automatic or manual). If the task is automatic, it will be performed once a day.

**6.5.3 Discovery scope**

Follow the steps below to limit the scope of a discovery task:

- Click the Settings menu at the top of the console. Then, click Network settings from the side menu and click the Discovery tab. Select a discovery computer and click Configure.
- Select an option in section **Discovery scope**:
  - **Search only on the subnet of the discovery computer**: The discovery computer will use the network mask configured on the interface to scan its subnet for unmanaged computers.
  - **Search only in the following IP address ranges**: you can enter several IP ranges separated by commas. The IP ranges must have a "-" (dash or hyphen) in the middle.
  - **Search for computers in the following domains**: specify the Windows domains that the discovery computer will search in, separated by commas.

**6.5.4 Scheduling computer discovery tasks**

**Scheduling a task**

You can schedule computer discovery tasks so that they are automatically launched by the discovery computer at regular intervals.
Figure 20: access to the discovery task settings window

- **Automatic execution of discovery tasks**
  - Click the **Settings** menu at the top of the console. Then, click **Network settings** from the side menu and click the **Discovery** tab. Select a discovery computer and click **Configure**.
  - From the **Run automatically** drop-down menu, select **Every day**.
  - Select the start time of the scheduled task.
  - Select whether to take the discovery computer's local time or the **Panda Endpoint Protection / Plus** server time as reference.
  - Click **OK**. The discovery computer will show a summary of the scheduled task in its description.

- **Manual execution of discovery tasks**
  - Click the **Settings** menu at the top of the console. Then, click **Network settings** from the side menu and click the **Discovery** tab. Select a discovery computer and click **Configure**.
  - From the **Run automatically** drop-down menu, select **No**.
  - Click **OK**. The computer will display a **Check now** link which you can use to run a discovery task on demand.

### 6.5.5 List of discovered computers

Displays the unmanaged devices found by **Panda Endpoint Protection / Plus**.

There are two ways to access this list:

- From the **Protection status widget**
- From **My lists**

- **Protection status widget**

Go to the **Status** menu at the top of the console. You'll see the **Protection status** widget on the **Panda Endpoint Protection / Plus** dashboard. At the bottom of the widget you'll see the following text: **xX computers have been discovered that are not being managed by Panda Endpoint Protection / Plus.**
• **My lists**

Go to **My lists** on the left-hand side menu and click the **Add** link. From the drop-down menu, select the list **Unmanaged computers discovered**.

**Description of the list of discovered computers**

<table>

Table 5: fields in the list of discovered computers

Next is a description of the possible error messages:

- **Wrong credentials.** The entered credentials don't have sufficient privileges to perform the installation.
- **Discovery computer not available:** The discovery computer that found the unmanaged workstation or server has been deleted and the installation cannot be run.
- **Unable to connect to the computer:**
  - The computer is turned off.
  - The firewall is preventing the connection.
  - The computer's operating system is not supported.
- **Unable to download the agent installer:**
  - The downloaded package is corrupt.
  - There is no installation package for the operating system of the workstation/server.
  - There is not enough free space on the computer to download the agent package.
  - The agent package download was very slow and has been canceled.
- **Unable to copy the agent:**
  - There is not enough free space on the computer to copy the agent package.
- **Unable to install the agent:**
  - There is not enough free space on the computer to install the agent.
  - An agent is already installed on the computer. If both agents are the same version, the installation will be launched in repair mode.
- **Unable to register the agent:**
  - The computer must be restarted before the agent can be uninstalled.
  - **Panda Endpoint Protection** is installed on the remote computer.

### Hidden computers

To avoid generating too long lists of discovered computers that may contain computers not eligible for *Panda Endpoint Protection / Plus* installation, it is possible to hide computers selectively by following the steps below:

![Figure 22: discovered/Hidden computer list selector](image-url)
- From the list of discovered computers, select **Discovered** (1) and click **Filter** (2).
- Select the checkboxes that correspond to the computers that you want to hide (3).
- To hide multiple computers simultaneously, click the general context menu and select **Hide and do not discover again** (4).
- To hide a single computer, click the computer's context menu and select **Hide and do not discover again** (5).

**Deleted computers**

**Panda Endpoint Protection / Plus** doesn't remove, from the list of discovered computers, those discovered computers that are no longer accessible because they have been withdrawn from the network due to inspection, malfunction, theft or for any other reason.

To manually remove those computers that are no longer accessible follow the steps below:

- From the list of discovered computers, select **Discovered** or **Hidden** depending on the status of the relevant computers (1).
- Select the checkboxes that correspond to the computers that you want to delete (2).
- To delete multiple computers simultaneously, click the general context menu and select **Delete** (3).
- To delete a single computer, click the computer's context menu and select **Delete** (4).

---

Any computer that is deleted by you from the console without uninstalling the Panda Endpoint Protection / Plus software and without being physically withdrawn from the network will appear again in the next discovery task. Only delete those computers that you are sure will never be accessible again.

---

### 6.5.6 Details of a discovered computer

Click a discovered computer to view its details window. This window is divided into 3 sections:

- **Computer alerts** (1): shows installation problems.
- **Computer details** (2): gives a summary of the computer's hardware, software and security
- **Last discovery computer** (3): shows the discovery computer that last saw the unmanaged computer.

**Computer alerts**

- **Error installing the Panda agent**: this message specifies the reason why the agent installation failed.
  - Wrong credentials. Launch the installation again using credentials with sufficient privileges to perform the installation.
  - Discovery computer not available.
  - Unable to connect to the computer. Make sure the computer is turned on and meets the remote installation requirements.
  - Unable to download the agent installer. Make sure the computer is turned on and meets the remote installation requirements.
- Unable to copy the agent installer. Make sure the computer is turned on and meets the remote installation requirements.

- Unable to install the agent. Make sure the computer is turned on and meets the remote installation requirements.

- Unable to register the agent. Make sure the computer is turned on and meets the remote installation requirements.

**Computer details**

</tbody>
</table>

*Figure 23: details of a discovered computer*

- **Error installing the Panda Endpoint Protection / Plus protection:** this message indicates the reason for the protection installation error.
  - Insufficient disk space to perform the installation.
  - Windows Installer is not operational.
  - Removal of the third-party protection installed was canceled by the user.
  - Another installation is in progress.
  - Error automatically uninstalling the third-party protection installed.
  - There is no uninstaller available to remove the third-party protection installed.

- **Installing Panda agent:** once the installation process is complete, the computer will no longer appear on the list of discovered computers.

- **Hidden computer.**

- **Unmanaged computer:** the computer doesn’t have the Panda agent installed.

**Computer details**

- **Computer name**

- **Description:** lets you assign a description to the computer, even though it is currently not managed.
- **First seen**: date/time when the computer was first discovered.
- **Last seen**: date/time when the computer was last discovered.
- **IP address**
- **Physical addresses (MAC)**
- **Domain**: Windows domain the computer belongs to.
- **NIC manufacturer**: manufacturer of the computer's network interface card.

**Last discovery computer**
- **Computer**: name of the discovery computer that last found the unmanaged computer.
- **Last seen**: date/time when the computer was last discovered.

### 6.5.7 Installing the protection on computers

To remotely install the **Panda Endpoint Protection / Plus** software on one or more computers on your network follow the steps below:

**From the list of discovered computers**
- Go to the list of discovered computers. There are three ways to do this:
  - Go to **My lists** on the left-hand side menu and click the **Add** link. From the drop-down menu, select the **Unmanaged computers discovered** list.
  - Go to the **Status** menu at the top of the console. In the Protection status widget, click the link **XX computers have been discovered that are not being managed by Panda Endpoint Protection / Plus**.
  - Go to the **Computers** menu at the top of the console. Click **Add computers** and select **Discovery and remote installation**. A wizard will be displayed. Click the link **View unmanaged computers discovered**.
- From the list of discovered computers, select **Discovered** or **Hidden** depending on the status of the relevant computers (1).
- Select the checkboxes that correspond to the computers that you want to install the software on.
- To install it on multiple computers simultaneously, click the general context menu and select **Install Panda agent**.
- To install it on a single computer, click the computer's context menu and then click **Install Panda agent**.
- Configure the installation by following the steps described in section 6.4.
- You can enter one or multiple installation credentials. Use the local administrator account of the target computer or the domain that it belongs to in order to install the software successfully.

**From the computer details window**

Click a discovered computer to display its details window. At the top of the screen you'll see the button **Install Panda agent**. Follow the steps detailed in section 6.4.
6.6. Installation with centralized tools

There are third-party tools that can help you install the Panda Endpoint Protection / Plus software centrally on Windows devices across medium-sized and large networks.

6.6.1 Using the command line to install the installation package

You can automate the installation and integration of the Panda agent into the management console by using the following command-line parameters:

- **IGNORE_LEGACY_AGENT=TRUE\|FALSE**: keeps the Panda Endpoint Protection / Plus agent of the traditional platform (legacy) product if already installed. The default value is FALSE; if the legacy product's agent is already installed on the computer, the installation process is interrupted.

- **GROUPPATH="group1\group2"**: path in the group tree where the computer will reside. The 'All' root node is not specified. If the group doesn't exist, the computer will be integrated into the 'All' root node.

- **PRX_SERVER**: name or IP address of the corporate proxy server.

- **PRX_PORT**: port of the corporate proxy server.

- **PRX_USER**: user of the corporate proxy server.

- **PRX_PASS**: password of the corporate proxy server.

Below is an example of how to install the agent using command-line parameters:

```
Msiexec /i "PandaAetherAgent.msi" GROUPPATH="London\AccountingDept"
PRX_SERVER="ProxyCorporate" PRX_PORT="3128" PRX_USER="admin" PRX_PASS="panda"
IGNORE_LEGACY_AGENT=TRUE
```

6.6.2 Deploying Panda Endpoint Protection / Pro from Panda Systems Management

Panda Systems Management customers can deploy Panda Endpoint Protection / Pro for Windows, macOS and Linux automatically using the following components:

- Panda Endpoint Protection on Aether Installer for Windows

- Panda Endpoint Protection on Aether Installer for macOS

- Panda Endpoint Protection on Aether Installer for Linux

All three components are available for free from the Comstore for all Panda Systems Management users.
Component features and requirements

These components don't have any specific requirements besides those indicated for Panda Systems Management and Panda Endpoint Protection / Pro on Aether.

Component size:

- Panda Endpoint Protection on Aether Installer for Windows: 1.5 MB
- Panda Endpoint Protection on Aether Installer for macOS: 3 KB
- Panda Endpoint Protection on Aether Installer for Linux: 3 KB

Once deployed and run, the component downloads the Panda Endpoint Protection on Aether installer. Depending on the version, the installer will take up between 6 to 8 MB on each computer.

6.6.3 Deploying Panda Endpoint Protection / Pro with Microsoft Active Directory

Below we have listed the steps to take to deploy the Panda Endpoint Protection / Pro software to Windows computers on a network with Active Directory using GPO (Group Policy Object).

1. **Download and share the Panda Endpoint Protection / Pro installer**
   - Move the Panda Endpoint Protection / Pro installer to a shared folder which is accessible to all the computers that are to receive the software.

2. **Create a new OU (Organizational Unit) called “Panda Endpoint Protection”**
   - Open the “Active Directory Users and Computers” applet in the network’s Active Directory.

![Figure 24: create an Organizational Unit](image-url)
- Open the Group Policy Management snap-in and, in Domains, select the newly created OU to block inheritance.

![Figure 25: block inheritance](image1)

- Create a new GPO in the “Panda Endpoint Protection” OU.

![Figure 26: create a GPO](image2)

3. **Add a new installation package to the newly created GPO**

- Edit the GPO.
- Add a new installation package which contains the **Panda Endpoint Protection / Plus** software. To do this, you will be asked to add the installer to the GPO.

4 **Edit the deployment properties**

- Go to Properties, Deployment, Advanced, and select the checkbox to avoid checking the target operating system against the one defined in the installer.
Finally, in the Panda Endpoint Protection OU you created in “Active Directory Users and Computers”, add all the network computers to which the software will be sent.

6.7. Installation on virtual environments, VDI, and automated deployments

In large networks made up of many homogeneous computers, it is possible to automate the process of installing the operating system and the accompanying tools.

This automation consists of creating a base image (also known as master image, golden image or clone image), by installing on a virtual or physical computer an up-to-date operating system and every software that users may need, including security tools. Once ready, a copy of the computer's hard disk is extracted which is then copied to the others computers on the network, substantially reducing deployment times.

However, if the network administrator uses this automated deployment procedure and Panda Endpoint Protection / Plus is part of the base image, it will be necessary to take some additional steps for the procedure to be successful.
Every computer where *Panda Endpoint Protection / Plus* is installed is assigned a unique ID. This ID is used by Panda Security to identify the computer in the management console. Therefore, if a golden image is generated from a computer with *Panda Endpoint Protection / Plus* installed, and then cloned to other systems, every computer that receives it will inherit the same *Panda Endpoint Protection / Plus* ID and, consequently, the console will only display one computer.

This can be avoided by using a program that deletes the ID generated when installing the software on a computer. This program is called *Panda Aether tool* and can be downloaded from Panda Security's support website.

https://www.pandasecurity.com/uk/support/card?id=700050

This page will also provide you with specific instructions on how to install the Panda Endpoint Protection / Plus agent on a golden or master image.

### 6.8. Uninstalling the software

You can uninstall the *Panda Endpoint Protection / Plus* software manually from the operating system's control panel, or remotely from the *Computers* area or from the *Computer protection status* and *Licenses* lists.

#### 6.8.1 Manual uninstallation

The Endpoint Protection software can be manually uninstalled by end users themselves, provided the administrator has not set an uninstallation password when configuring the security profile for the computer in question. If an uninstallation password has been set, the end user will need authorization or the necessary credentials to uninstall the protection.

Installing *Panda Endpoint Protection / Pro* actually installs multiple independent programs depending on the target platform:

- **Windows and macOS computers**: agent and protection.
- **Linux computers**: agent, protection and kernel module.
- **Android devices**: protection.

To completely uninstall *Panda Endpoint Protection / Pro*, all modules must be removed. If only the protection module is uninstalled, the agent will install it again after some time.

**On Windows 8 and later:**
- Control Panel > Programs > Uninstall a program.
- Alternatively, type 'uninstall a program' at the Windows Start Screen.

**On Windows Vista, Windows 7, Windows Server 2003 and later:**
- Control Panel > Programs and Features > Uninstall or change a program.
On Windows XP:
- Control Panel > Add or remove programs.

On macOS:
- Finder > Applications > Drag the icon of the protection to uninstall to the recycle bin, or run the following command: `sudo sh /Applications/Protection-Agent.app/Contents/uninstall.sh`.
- Dragging the icon to the recycle bin doesn't uninstall the agent. To remove it, you have to run the following command: `sudo sh /Applications/Management-Agent.app/Contents/uninstall.sh`.

On Android devices:
- Go to Settings > Security > Device administrators.
- Clear the *Panda Endpoint Protection / Plus* checkbox. Then, tap Disable > OK.
- Back in the Settings window, tap Apps. Click *Panda Endpoint Protection / Plus* > Uninstall > OK.

On Linux:

On Linux, use the desktop environment to manage the packages included in the distribution.
- **Fedora**: Activities > Software > Installed
- **Ubuntu**: Ubuntu software > Installed

We recommend using the command line to uninstall the product:
- **Ubuntu**
  - *Agent*: `sudo dpkg -r management-agent`
  - *Kernel*: `sudo dpkg -r protection-agent-dkms`
  - *Protection*: `sudo dpkg –r protection-agent-corporate`
- **Fedora** (replace “version” with the package build by pressing the TAB key)
  - *Agent*: `sudo dnf remove management-agent-“version”`
  - *Kernel*: `sudo dnf remove protection-agent-dkms-“version”`
  - *Protection*: `sudo dnf remove protection-agent-corporate-“version”`

### 6.8.2 Manual uninstallation results

Uninstalling the *Panda Endpoint Protection / Plus* software (Panda agent and protection) from a computer will cause it to disappear completely from the management console along with its associated information (counters, reports, computer activity and process activity information, etc.).

If, later, the computer is reintegrated into the management console by reinstalling the *Panda Endpoint Protection / Plus* software, all previously-deleted information will be immediately retrieved.
6.8.3 Remote uninstallation

Follow these steps to remotely uninstall the Panda Endpoint Protection / Plus software from a Windows computer:

- Access the Computers area (or the Licenses or Computer protection status lists), and select the checkboxes of the computers whose protection you want to uninstall.
- From the action bar, click the Delete button. A confirmation window will be displayed.
- In the confirmation window, select the Uninstall the Panda agent from the selected computers checkbox to completely remove the Panda Endpoint Protection / Plus software.

Once uninstalled, all data associated with the computers will disappear from the management console and its different counters (malware detected, URLs blocked, emails filtered, devices blocked, etc.). However, all that information will be retrieved as soon as you reinstall the Panda Endpoint Protection / Plus software.

Remote uninstallation is only supported on Windows platforms. On Linux and macOS platforms, the affected computer and its associated information will be removed from the management console and its counters, but they will immediately reappear in the next discovery task.
7. Managing computers and devices

The Computers area
The Computer list panel
The computers tree panel
The Filters tree
The Groups tree
Computer details
7.1. Introduction

The management console lets you display the computers managed in an organized and flexible way, enabling administrators to rapidly locate devices.

7.1.1 Requirements for managing computers from the management console

In order for a network device to be managed through the management console, the Panda agent must be installed on the device.

As with other Panda Security products based on Aether, Panda Endpoint Protection / Plus delivers the Panda agent in the installation package for all compatible platforms.

Devices without a Panda Endpoint Protection / Plus license but with Panda agent installed will appear in the management console, although the protection will be uninstalled and scan tasks or other Panda Endpoint Protection / Plus resources won’t be run.

⚠️ Computers with expired licenses will still be scanned for threats, but the signature file won’t be updated. In this condition, Panda Endpoint Protection / Plus won’t be an effective solution to combat threats. Panda Security strongly recommends that organizations renew the contracted services in order to keep their network protected.

7.2. The Computers area

Figure 30: general view of the panels in the Computers area
To access the area for managing devices, click the **Computers** menu. Two different areas are displayed: the side panel with the **Computers tree** (1) and the main panel with the **List of computers** (2). Both panels work together and this chapter explains how they operate.

When you select an item from the **Computers tree**, the **Computers list** is updated with all the devices assigned to the selected section of the tree.

**Display computers in subgroups**

It is possible to restrict the list of devices by displaying only those that belong to the selected branch of the tree, or alternatively by displaying all devices in the selected branch and its corresponding sub-branches. To do this, click the context menu and select **Show computers in subgroups**.

![Figure 31: show computers in subgroups](image)

### 7.3. The Computers list panel

The **Computers screen** shows the workstations and servers belonging to the group or filter selected in the computer tree. It also provides management tools you can use on individual computers or on multiple computers at the same time.

The figure below shows all items that make up the **Computers screen**:

- **(1)** List of computers belonging to the selected branch.
- **(2)** Search tool. The search tool lets you find computers by their name. It supports partial matches and doesn't differentiate between uppercase and lowercase letters.
- **(3)** Context menu: lets you apply an action on multiple computers.
- **(4)** Selection checkboxes
- **(5)** There is a pager at the bottom of the screen to ease navigation.
- **(6)** Context menu
Select one or more computers using their checkboxes (4). The search tool (2) will be hidden and the action bar (7) will be displayed instead.

### Computers list

You will see the following details for each computer:

<table>
<thead>
<tr>
<th>Field</th>
<th>Comments</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer</td>
<td>Computer name and type (Desktop computer: Windows, Linux or macOS workstation or server; Laptop computer; Mobile device: Android smartphone or tablet)</td>

### 7.3.2 Management tools

Selecting the checkbox next to a computer (4) will display an action bar showing the management actions you can take on that device:

- **Move to**: Opens a window showing the group tree. Choose the group to move the computer to. The computer will inherit the settings assigned to the target group. Refer to Chapter 8 for more information about how to define settings.
- **Move to Active Directory path**: Moves the selected computer to the group that corresponds to its organizational unit in the organization’s Active Directory.
- **Delete**: Deletes the computer from the console and uninstalls the Panda Endpoint Protection / Plus software from it. Refer to chapter 6 Installing the Panda Endpoint Protection / Plus software for more information about how to uninstall the Panda Endpoint Protection / Plus software.
- **Scan now**: See later in this chapter for an introduction to scan tasks, or see chapter 14 Tasks for more information about immediate scan tasks.
- **Schedule scan**: See later in this chapter for an introduction to scan tasks, or see chapter 14 Tasks for more information about scheduled tasks.
- **Restart**: Refer to chapter 18 Remediation tools for more information about remote computer restart.
- **Schedule patch installation**: Refer to chapter 12 Panda Patch Management (Updating vulnerable programs) for more information on how to install patches on Windows computers.
- **X selected**: To undo the current selection, click the X selected button from the action bar.

### 7.4 The Computers tree panel

Panda Endpoint Protection / Plus displays the computers through the Computers tree (2), which offers three independent views or trees (1):

- **Filters tree**: this lets you manage network computers using dynamic groups. Computers are automatically assigned to these types of groups.
- **Groups tree**: this lets you manage network devices through static groups. Computers are manually assigned to these types of groups.
These three tree structures are designed to display computers and Android devices in different ways, in order to facilitate different tasks such as:

- Locate computers that fulfill certain criteria in terms of hardware, software or security.
- Easily assign security settings profiles.
- Take troubleshooting action on groups of computers.

Hover the mouse pointer over the branches in the Filters and Groups trees to display the context menu. Click it to display a pop-up menu with all available operations for the relevant branch.

### 7.5. Filters tree

The Filters tree is one of the two computers tree views, and it lets you dynamically group computers on the network using rules and conditions that describe characteristics of devices and logical operators that combine them to produce complex rules.

The Filters tree can be accessed from the left-hand panel, by clicking the filter icon.
Clicking different items in the tree will update the right-hand panel, presenting all the computers that meet the criteria established in the filter.

7.5.1 What is a filter?
Filters are effectively dynamic groups of computers. A computer automatically belongs to a filter when it meets the criteria established for that filter by the administrator.

A computer can belong to more than one filter.
As such, a filter comprises a series of rules or conditions that computers have to satisfy in order to belong to it. As computers meet the conditions, they join the filter. Similarly, when the status of the computer changes and ceases to fulfill the conditions, it will automatically cease to belong to the group defined by the filter.

7.5.2 Groups of filters

The filters can be grouped manually in folders using whatever criteria the administrator chooses.

7.5.3 Predefined filters

Panda Endpoint Protection / Plus includes a series of commonly used filters that administrators can use to organize and locate network computers. Predefined filters can also be edited or deleted.

⚠️ A predefined filter that has been deleted cannot be recovered.

Table 11: List of predefined filters

7.5.4 Creating and organizing filters

The actions you can take on filters are available through the pop-up menu displayed when clicking the context menu for the relevant branch in the Filters tree.

Creating filters

To create a filter, follow the steps below:

- Click the context menu of the folder where the filter will be created.
- Click **Add filter**.
- Specify the name of the filter. It does not have to be a unique name. The configuration of the filter is described later in this chapter.

Creating folders

Click the context menu of the branch where you want to create the folder, and click **Add folder**.

Enter the name of the folder and click **OK**.

Filters cannot be nested if they are not in folders. If you select a filter in the tree, the newly created filter will be at the same level, in the same folder.

A folder cannot be under a filter. If you select a filter before creating a folder, this will be created at the same level as the filter, under the same parent folder.
**Deleting filters and folders**
Click the context menu of the branch to delete, and click **Delete**. This will delete the branch and all of its children.

---

**Moving and copying filters and folders**
To move or copy a filter or folder, follow the steps below:

- Click the context menu of the branch to copy or move.
- Click **Move** or **Make a copy**. A pop-up window will appear with the target filter tree.
- Select the target folder and click **OK**.

---

**Renaming filters and folders**
To rename a filter or folder, follow the steps below:

- Click the context menu of the branch to rename.
- Click **Rename**.
- Enter the new name.

---

**Filter settings**
To access the filter settings window, create a new filter or edit an existing one.

A filter comprises one or more rules, which are related to each other with the logical operators **AND** / **OR**. A computer will be part of a filter if it meets the conditions specified in the filter rules.

A filter has four sections:

- **Filter name (1)**: this identifies the filter.
- **Filter rules (2)**: this lets you set the rules for belonging to a filter. A filter rule only defines one characteristic.
- **Logical operators (3)**: these let you combine filter rules with the values **AND** or **OR**.
- **Groups (4)**: this lets you alter the order of the filter rules related with logical operators.
7.5.6 Filter rules

A filter rule comprises the items described below:

- **Category (1)**: this groups the properties in sections to make it easy to find them.
- **Property (2)**: the characteristic of a computer that determines whether it belongs to a filter.
- **Operation (3)**: this determines the way in which the computer’s characteristics are compared to the values set in the filter.
- **Value (4)**: the content of the property. Depending on the type of property, the value field will change to reflect entries such as ‘date’, etc.

To add rules to a filter, click the icon. To delete them, click .

7.5.7 Logical operators

To combine two rules in the same filter, use the logical operators **AND** or **OR**. This way, you can inter-relate several rules. The options **AND**/**OR** will automatically appear to condition the relation between the rules.
7.5.8 Groups of filter rules

A group involves the use of parentheses in a logical expression. In a logical expression, parentheses are used to alter the order of the operators; in this case, the filter rules.

As such, to group two or more rules in parenthesis, you have to create a group by selecting the corresponding rules and clicking **Group**. A thin line will appear covering the filter rules that are part of the group.

Groups with several levels can be defined in the same way that you can nest groups of logical operators by using parentheses.
7.6. Groups tree

The Groups tree lets you statically combine the computers on the network in the groups that the administrator chooses.

The Groups tree is accessible from the left panel by clicking the folder icon.

By clicking the different items in the tree, the panel on the right is updated, presenting all the computers in the selected group and its subgroups.

7.6.1 What is a group?

A group contains the computers manually assigned by the administrator. The Groups tree lets you create a structure with a number of levels comprising groups, subgroups and computers.
7.6.2 Group types

- **Root group**: This is the parent group from which all other folders derive.
- **Native groups**: these are the Panda Endpoint Protection / Plus standard groups. They support all operations (move, rename, delete, etc.) and contain other standard groups and computers.
- **Active Directory groups**: these groups replicate the Active Directory structure that already exists in your organization. Some operations cannot be performed on these groups. They contain other Active Directory groups and computers.
- **Active Directory root group**: contains all of the Active Directory domains configured on the organization's network. It contains Active Directory domain groups.
- **Active Directory domain group**: Active Directory branches representing domains. They contain other Active Directory domain groups, Active Directory groups and computers.

7.6.3 Groups structure

Depending on the size of the network, the homogeneity of the managed computers, and the presence or absence of an Active Directory server in your organization, the group structure can vary from a single-level tree in the simplest cases to a complex multi-level structure for large networks comprising numerous and varied computers.

Unlike filters, a computer can only belong to a single group.

7.6.4 Active Directory groups

For those organizations that have an Active Directory server installed on their network, Panda Endpoint Protection / Plus can automatically obtain the configured Active Directory structure and replicate it in the Groups tree. This way, the branch will show a computer distribution familiar to the administrator, helping them find and manage their computers faster.

To automatically replicate the Active Directory structure existing in the organization, the Panda agents report the Active Directory group they belong to to the Web console and, as agents are deployed, the tree is populated with the various organizational units.

The Active Directory tree cannot be modified from the Panda Endpoint Protection / Plus console, it will only change when the underlying Active Directory structure is also changed. These changes are replicated in the Panda Endpoint Protection / Plus Web console within 15 minutes.
7.6.5 Creating and organizing groups

The actions you can take on groups are available through the pop-up menu displayed when clicking the context menu for the relevant branch in the Groups tree.

Creating groups

Click the context menu of the parent group to which the new group will belong, and click Add group.

You cannot create Active Directory groups in the Groups tree. The solution only replicates the groups and organizational units that already exist on your organization’s Active Directory server.

Deleting groups

Click the context menu of the group to delete. If the group contains subgroups or computers, the management console will return an error.

The All root node cannot be deleted

To delete the empty Active Directory groups included in another group, click the group’s context menu and select Delete empty groups.

Moving groups

To move a group, follow the steps below:

- Click the context menu of the group to move.
- Then click Move. A pop-up window will appear with the target Groups tree.
- Select the group and click OK.

Neither the All root node nor Active Directory groups can be moved

Renaming groups

To rename a group, follow the steps below:

- Click the context menu of the group to rename.
- Click Change name.
- Enter the new name.
Neither the All root node nor Active Directory groups can be renamed.

7.6.6 Moving computers from one group to another

Administrators have several options to move one or more computers to a group:

**Moving groups of computers to groups**

To move several computers to a group at the same time, follow the steps below:

- Select the group All in order to list all the managed computers or use the search tool to locate the computers to move.
- Use the checkboxes to select the computers in the panel listing the computers.
- Click the icon at the right of the search bar. A drop-down menu will appear with the option Move to. Click here to show the target groups tree.
- Select the target Groups tree.

**Moving a single computer to a group**

There are three ways to assign a single computer to a group:

- Follow the steps described above for assigning groups of computers, but simply select a single computer.
- Use the checkbox to select the computer in the list and click the menu icon to the right.
- From the window with the details of the computer:
  - In the panel with the list of computers, click the computer you want to move in order to display the details.
  - In the Group field click Change. This will display a window with the target groups tree.
  - Select the target group and click OK.

**Moving computers from an Active Directory group**

Any computer found in an Active Directory group can be moved to a standard group, but not to another Active Directory group.

**Moving computers to an Active Directory group**

It is not possible to move a computer from a native group to a specific Active Directory group. You can only return it to the Active Directory group that it belongs to. To do this, click the computer's context menu and select Move to Active Directory path.

**Returning multiple computers to their Active Directory group**

To return multiple computers to their original Active Directory group, click the context menu of the group where they are and select Move computers to their Active Directory path. All computers that
belong to a group in the company's Active Directory and which have been moved by the administrator to other groups in the Panda Endpoint Protection / Plus console will be restored to their original Active Directory location.

### 7.6.7 Scan tasks

The group tree allows you to assign immediate or scheduled scan tasks to all computers belonging to a group and its subgroups.

**Immediate scans**

Click the **Scan now** option to launch an immediate scan of all computers belonging to a group or any of its subgroups. A window will be displayed for you to select the scan type to run: **The entire computer** or **Critical areas**. Refer to chapter 14 Tasks for more information about the scan types available in Panda Endpoint Protection / Plus.

**Scheduled scans**

Click the **Schedule scan** option to create a scheduled scan task. Refer to chapter 14 Tasks for more information about how to configure a scheduled task.

### 7.7 Computer details

When you select a computer from the list of computers, a window is displayed with details of the hardware and software installed, as well as the security settings assigned to it.

The Details window is divided into 6 sections:

- **General (1)**: this displays information to help identify the computer.
- **Notifications (2)**: details of any potential problems.
- **Details (3)**: this gives a summary of the hardware, software and security settings of the computer.
- **Hardware (4)**: here you can see the hardware installed on the computer, its components and peripherals, as well as resource consumption and use.
- **Software (5)**: here you can see the software packages installed on the computer, as well as versions and changes.
- **Settings (6)**: this shows the security settings and other settings assigned to the computer.
101

Figure 43: general view of the computer details

7.7.1 General section (1)
This contains the following information:

- **Name of the computer and icon** indicating the type of computer.
- **IP address**: IP address of the computer.
- **Active Directory path**: full path to the computer in the company's Active Directory.
- **Group**: the folder in the Groups tree to which the computer belongs.
- **Operating system**: full version of the operating system installed on the computer.
- **Computer role**: indicates if the computer has any of the following roles assigned to it: discovery computer, cache or proxy.

7.7.2 Computer notifications section (2)
These notifications describe any problems encountered on the computers with regard to the operation of **Panda Endpoint Protection / Plus**, as well as providing indications for resolving them. The following is a summary of the types of notifications generated and the recommended actions.

Unprotected computer:

- **Protection disabled**: a message is displayed stating that the antivirus or the Exchange protection is disabled. You are advised to assign protection settings to the computer with
the protections enabled. See Chapter 8 for assigning security settings and Chapter 9 for creating security settings.

- **Protection with errors**: a message is displayed stating that the antivirus protection or the Exchange protection has an error. Restart the computer or reinstall the software. See Chapter 6 to install the software on the computer and Chapter 17 to restart the computer.

- **Error installing the patch manager**: an error occurred while installing the patch manager (Panda Patch Management) on the computer.
  - **Unable to download**: installer not available.
  - **Unable to download**: the file is corrupted.
  - **Not enough disk space**.

- **Installation error**: the computer is unprotected because there was an error during installation. See Chapter 6 to reinstall the software on the computer.

- **Installation in progress**: the computer is unprotected because the installation of Panda Endpoint Protection / Plus is incomplete. Wait a few minutes until the installation is complete.

**Out-of-date computer:**

- **Computer pending restart**: the update for the security engine has been downloaded but the computer needs to be restarted for it to be applied. See Chapter 17 to restart the computer remotely.

- **Protection updates disabled**: the software won’t receive any improvements. This will jeopardize the security of the computer in the future. See Chapter 8 to create and assign ‘Per-computer settings’ that allow the software to be updated.

- **Knowledge updates disabled**: the software won’t receive any updates to the signature file. This will jeopardize the security of the computer in the short-term. See Chapters 10 and 11 to create security settings that allow the signature file to be updated.

- **Knowledge update error**: the download of the signature file failed. There is an explanation in this chapter of how to check the free space on your hard disk. See Chapter 17 to restart the computer. See Chapter 6 to reinstall software on the computer.

**Offline since...**

The computer has not connected to the Panda Security cloud in several days. Check the connectivity of the computer and the firewall settings. See chapter 10 Security settings for workstations and servers to check whether the connectivity requirements are fulfilled. See Chapter 6 to reinstall the software.

**Pending restart**

- The administrator has requested a restart which has not yet been applied.

- Patches have been installed that require a restart. The Restart computer button will be displayed.

### 7.7.3 Details section (3)

The information on this tab is divided into two sections: **Computer** (with information about the device settings provided by the Panda agent), and **Security** (with the status of the Panda Endpoint Protection / Pro protection).
Computer

- **Name:** computer name.
- **Description:** descriptive text provided by the administrator.
- **Physical addresses (MAC):** physical addresses of the network interface cards installed.
- **IP addresses:** list of all the IP addresses (main and alias).
- **Domain:** Windows domain that the computer belongs to. This is empty if it does not belong to a domain.
- **Active Directory path:** the path of the computer in the company’s Active Directory tree.
- **Group:** the group within the Groups tree to which the computer belongs. To change the computer’s group, click Change.
- **Operating system**
- **Mail server:** version of Microsoft Exchange server installed on the computer.
- **Virtual machine:** this indicates whether the computer is physical or virtual.
- **Licenses:** the Panda Security product licenses installed on the computer. For more information, see Chapter 5.
- **Agent version**
- **System boot date**
- **Installation date**
- **Last connection** of the agent to the Panda Security infrastructure. The communications agent will connect at least every four hours.

Security: this section indicates the status (Enabled, Disabled, Error) of the Panda Endpoint Protection / Plus technologies.

- **File Antivirus**
- **Mail Antivirus**
- **Web Browsing Antivirus**
- **Firewall protection**
- **Device Control**
- **Web Access Control** (in Panda Endpoint Protection Plus only)
- **Patch management**
- **Protection version**
- **Knowledge update date:** date when the signature file was last updated.

For more information about the security details of the protected computers, see chapter 15 Malware and network visibility.

7.7.4 Hardware section (4)

This contains the following information:
- CPU: information about the processor on the computer, and a line chart with CPU consumption at different time intervals based on your selection:
  - 5 minute intervals over the last hour.
  - 10 minute intervals over the last 3 hours.
  - 40 minute intervals over the last 24 hours.
- Memory: information about the memory chips installed, and a chart with memory consumption at different time intervals based on your selection:
  - 5 minute intervals over the last hour.
  - 10 minute intervals over the last 3 hours.
  - 40 minute intervals over the last 24 hours.
- Disk: information about the mass storage system, and a pie chart with the percentage of free/used space at that moment.

7.7.5 Software section (5)
This contains a list of the programs installed on the computer and all updates of the Windows operating system and other Microsoft programs. The information displayed is as follows:
  - **Name:** program name.
  - **Publisher:** program developer.
  - **Installation date**
  - **Size**
  - **Version**

Search tool
The tool that enables you to locate software packages using partial or complete matches in all the fields shown previously.

The drop-down menu lets you restrict the search to only updates, installed software or both.

Change log
The change log lists all the software installation and uninstallation events that take place within the configured date range. For each event, the following information is displayed:

  - **Event:** installation 📋 or uninstallation 📋
  - **Name:** name of the software package responsible for the event
  - **Publisher:** the program developer
  - **Version**
  - **Date**
7.7.6 Settings section (6)

The Settings section displays the different types of settings assigned to the computer, and allows you to edit and manage them:

- **(1) Settings type**: per-computer settings, Proxy and language settings, Settings for workstations and servers, Settings for Android devices.
- **(2) Settings name**.
- **(3) Method used to assign the settings**: assigned directly to the computer or inherited from a parent group.
- **(4) Button to change the settings assigned to the computer**.
- **(5) Button to edit the settings options**.

![Figure 44: editing and managing the assigned settings](image)

Refer to chapter 8 Managing settings for more information about how to create, edit and assign settings.

7.7.7 Action bar (7)

Shows the different actions you can take on the computer:

- **Move to**: moves the computer to a standard group.
- **Move to Active Directory group**: moves the computer to its original Active Directory group.
- **Delete**: frees up the Panda Endpoint Protection / Plus license and deletes the computer from the Web console.
- **Scan now**: lets you run a scan task immediately. Refer to chapter 17 Remediation tools for more information.
- **Schedule scan**: lets you schedule a scan task. Refer to chapter 17 Remediation tools for more information.
- **Schedule patch installation**: creates a task that installs all released patches missing from the target computer. See chapter 12 Panda Patch Management (Updating vulnerable programs) for more information.
- **Restart**: restarts the computer immediately. Refer to chapter 17 Remediation tools for more information.
- **Report a problem**: opens a support ticket for Panda Security's support department. Refer to chapter 17 Remediation tools for more information.
7.7.8 Hidden icons (8)

Depending on the size of the window and the number of icons to display, some of them may be hidden under the "..." icon. Click it to show all remaining icons.
8. Managing settings

What are settings?
Overview of assigning settings
Modular vs monolithic settings profiles
Overview of the four types of settings
Creating and managing settings
Manual and automatic assigning of settings
Viewing assigned settings
8.1. Introduction

This chapter looks at the resources implemented in Panda Endpoint Protection / Plus for managing the settings of network computers.

8.2. What are settings?

Settings, also called “settings profiles” or simply “profiles”, offer administrators a simple way of establishing the security, productivity and connectivity parameters on the computers managed through Panda Endpoint Protection / Plus.

Administrators can create as many profiles and variations of settings as they deem necessary. The need for new settings may arise from the varied nature of computers on the network:

- Computers used by people with different levels of IT knowledge require different levels of permissiveness with respect to the running of software, access to the Internet or to peripherals.
- Users with different tasks to perform and therefore with different needs require settings that allow access to different resources.
- Users that handle confidential or sensitive information require greater protection against threats and attempts to steal the organization’s intellectual property.
- Computers in different offices require settings that allow them to connect to the Internet using a variety of communication infrastructures.
- Critical servers require specific security settings.

8.3. Overview of assigning settings to computers

In general, assigning settings to computers is a four-step process:

1. Creation of groups of similar computers or with identical connectivity and security requirements

2. Assigning computers to a corresponding group

3. Assigning settings to groups

4. Immediate and automatic pushing out of settings to network computers

All these operations are performed from the Groups tree, which can be accessed from the Computers menu. The Groups tree is the main tool for assigning settings quickly and to large groups of computers.
Administrators therefore have to put similar computers in the same group and create as many groups as there are different types of computers on the network.

**8.3.1 Immediate deployment of settings**

Once settings are assigned to a group, they will be applied to the computers in the group immediately and automatically, in accordance with the inheritance rules described later in this chapter. The settings are applied to the computers in just a few seconds.

**8.3.2 Multi-level trees**

In medium-sized and large organizations, there could be a wide range of settings. To facilitate the management of large networks, *Panda Endpoint Protection / Plus* lets you create group trees with various levels.

**8.3.3 Inheritance**

In large networks, it is highly likely that administrators will want to reuse existing settings on groups within the hierarchical structure of the tree. The inheritance feature lets you assign settings to a group and then, in order to save time, automatically to all the groups below this group in the tree.

**8.3.4 Manual settings**

To prevent settings being applied to all inferior levels in the Groups tree, or to assign different settings to a certain computer in part of the tree, it is possible to manually assign settings to groups or individual computers.

**8.3.5 Default settings**

Initially, all computers in the Groups tree inherit the settings established in the **All** root node.

The **All** root node has the following settings set by default:
- **Per-computer settings**: default settings.
- **Proxy and language**: default settings.
- **Security settings for workstations and servers**: default settings.
- **Security settings for Android devices**: default settings.
- **Patch management**: default settings.

This means that all computers are protected from the outset, even before administrators have accessed the console to establish security settings.

### 8.4. Modular vs monolithic settings profiles

**Panda Endpoint Protection / Plus** uses a modular format for creating and distributing settings to computers. As such, there are four independent profiles covering four settings areas.

The four types of profiles are as follows:

- **Per-computer settings**.
- **Proxy and language settings**.
- **Security settings for workstations and servers**.
- **Patch management**.

The reason for using this modular format and not just a single, monolithic profile that covers all the settings is to reduce the number of profiles created in the management console. The modular format means that the settings are lighter than monolithic configurations that result in numerous large and redundant profiles with little differences between each other. This in turn reduces the time that administrators have to spend managing the profiles created.

This modular format means it is possible to combine several settings that adapt to the needs of the user, with a minimal number of different profiles.

**Case study: creating settings for several offices**

In this example, there is a company with five offices, each with a different communications infrastructure and therefore different proxy settings. Also, each office requires three different security settings, one for the Design department, another for the Accounts department and the other for Marketing.
If *Panda Endpoint Protection / Plus* implemented all the configuration parameters in a single monolithic profile, the company would require 15 different settings profiles (5 x 3 = 15) to adapt to the needs of all three departments in the company’s offices.

However, as *Panda Endpoint Protection / Plus* separates the proxy settings from the security settings, the number of profiles needed is reduced (5 proxy profiles + 3 department profiles = 8) as the security
profiles for each department in one of the offices can be reused and combined with the proxy profiles in other offices.

### Proxy and Language modular profile

1. Office 1
2. Office 2
3. Office 3
4. Office 4
5. Office 5
6. Office 3
7. Office 4
8. Office 5

### Security modular profile

2. Office 1
3. Office 2
4. Office 3
5. Office 4
6. Office 5
7. Office 3
8. Office 4

---

**8.5. Overview of the types of settings**

Refer to chapters 9, 10, and 11 for more information about the Panda agent settings and the protections compatible with each supported platform.

**Proxy and language**

These settings let you define the language of the agent installed on end users' computers and the proxy server used to connect to the Internet.

**Per-computer settings**

Let you define several settings pertaining to the Panda agent:

- Update frequency of the *Panda Endpoint Protection / Plus* software installed on computers. Refer to chapter 13 Software updates.
- Password required to install the agent on end users' computers.
- Anti-Tamper protection.

**Workstation and server**

Let you define the security settings of the Windows, macOS and Linux computers on your network, both workstations and servers.

**Patch Management**

Let you define the discovery of missing patches across your network.

**Android device settings.**

This type of profile defines the security settings of Android devices (tablets and smartphones).

### 8.6. Creating and managing settings

Creating, copying and deleting settings is carried out by clicking **Settings** in the menu bar at the top of the screen. In the panel on the left there are four sections corresponding to the types of available settings profiles (1), (2), (3) (4) and (5). In the right-hand panel, you can see the settings profiles of the selected category that have already been created (7), and the buttons for adding (6), copying (8) and deleting profiles (9).

![Figure 46: screen for creating and managing settings profiles](image)

**Creating settings**

Click **Add** to display the window for creating settings. All profiles have a main name and a description, which are displayed in the list of settings.
Copying and deleting settings

Use the icons (8) and (9) to copy and delete a settings profile, although if it has been assigned to one or more computers, you won't be able to delete it until it has been freed up. Click the settings profile in order to edit it.

Before editing a profile, check that the new settings are correct, as if the profile has already been assigned to your computers on the network, the changes will be applied automatically and immediately.

8.7. Manual and automatic assigning of settings to groups of computers

Once settings profiles have been created, they can be assigned to computers in two different ways:

- Manually (direct)
- Automatically through inheritance (indirectly)

These strategies complement each other and it is highly advisable that administrators understand the advantages and limitations of each one in order to define the most simple and flexible structure possible, in order to minimize the workload of daily maintenance tasks.

8.7.1 Assigning settings directly/manually

Manually assigning settings involves the administrator directly assigning profiles to computers or groups.

Once settings profiles have been created, there are three ways of assigning them:

- From the **Computers** option in the menu at the top of the screen, through the Groups tree shown in the panel on the left.
- From the computer details in the list of computers, also accessible from the **Computers** menu.
- From the profile itself when it is created or edited.

For more information about the Groups tree, see Chapter 7.

From the Groups tree

To assign a settings profile to the computers in a group, click the **Computers** menu at the top of the console, and select a group from the left-hand Groups tree. Then, follow the steps below:

- Click the group's context menu.
- Click **Settings**. A window will open with the profiles already assigned to the selected group and the type of assignment:
  - **Manual/Direct assignment** the text will read *Directly assigned to this group.*
  - **Inherited/Indirect assignment** the text will read *Settings inherited from*, followed by the name and full path of the group the settings were inherited from.
- Select the new settings and click **OK** to assign the settings to the group.
- The settings will immediately be deployed to all members of the group and sub-groups.
- The changes will immediately apply to all corresponding computers.

**From the computer list panel**

To assign a settings profile to a specific computer, follow the steps below:

- In the **Computers** menu, click the group or filter containing the computer to which you want to assign the settings. Click the computer in the list of computers in the right-hand panel to see the computer details screen.
- Click the **Settings** tab. This will display the profiles assigned to the computer and the type of assignment:
  - **Manual/Direct assignment** the text will read *Directly assigned to this group.*
  - **Inherited/Indirect assignment** the text will read *Settings inherited from*, followed by the name and full path of the group the settings were inherited from.

![Figure 47: access to settings from the computer details tab.](image)

- Select the new settings. They will be applied automatically to the computer.

**From the settings profile itself**

The quickest way to assign a settings profile to several computers belonging to different groups is via the settings profile itself.

Follow the steps below to assign a settings profile to multiple computers or computer groups:
- Go to the **Settings** menu at the top of the console and select the type of settings that you want to assign from the left-hand side menu.

- Select a specific settings profile from those available, and click **Recipients**. A window will be displayed divided into two sections: **Computer groups** and **Additional computers**.

- Click the **+** button to add computers or computer groups to the settings profile.

- Click the **Add** button. The profile will be assigned to the selected computers and the new settings will be immediately applied.

---

**8.7.2 Indirect assigning of settings: the two rules of inheritance**

Indirect assigning of settings is applied through inheritance, which allows automatic deployment of a settings profile to all computers in the node to which the settings have been applied.

The rules that govern the relation between the two forms of assigning profiles (manual/direct and automatic/inheritance) are displayed below in order of priority:

1. **Automatic inheritance rule**: a group or computers automatically inherits the settings of the parent group or one above it in the hierarchy.

---

![Diagram of inheritance](image)

**Figure 48**: example of inheritance/indirect assigning. The parent group receives the settings that are then pushed out to the child nodes.
2 **Manual priority rule:** manually assigned profiles have priority over inherited ones.

**Figure 49:** example of the priority of direct assigning over indirect. The inherited settings are overwritten with the manually assigned ones

### 8.7.3 Inheritance limits

The settings assigned to a group (manual or inherited) are applied to all branches of the tree, until manually assigned settings are found.
Figure 50: example of inheritance restricted by manual/direct assignment of settings. The parent node settings are passed on to the dependent branches of the tree but stop once manually assigned settings are found.

8.7.4 Overwriting settings

As illustrated in the previous point, rule 2 (manual priority) dictates that manually applied settings have preference over inherited settings. This is the case in a typical scenario where initially inherited settings are applied to the whole tree, and then some items have special manual settings applied.

However, it is often the case that once the inherited and manual settings have been applied, there may be a change to the inherited settings in a higher level node that affects the manual settings of items lower down.
In this case, **Panda Endpoint Protection / Plus** asks the administrator if the previously set manual settings are to be kept or overwritten with the inheritance:

- If the inherited settings have priority, the new settings will be inherited by all subordinate items, regardless of whether there are manually assigned settings or not and deleting any manual settings.
- If the manual settings have priority, the new settings are only inherited in those groups where no manual settings have previously been assigned, and any manual settings are maintained.
Some subgroups and/or computers have settings that have been directly assigned to them, instead of inherited from this group.

What do you want to do with the settings directly assigned to your subgroups and/or computers?

Keep all settings

Make all inherit these settings

Figure 52: window for selecting the way that settings changes are applied to a branch containing groups configured manually

This way, when the system detects a change to the settings that has to be applied to subordinate nodes, and one or more of them have manually assigned settings (regardless of the level) a screen appears asking the administrator which option to apply: Make all inherit these settings or Keep all settings.

Make all inherit these settings

⚠️ Be careful when choosing this option as it is not reversible! All manually applied settings below the node will be lost, and the inherited settings will be applied immediately to the computers. This could change the way Panda Endpoint Protection / Plus acts on many computers.
The choice to overwrite the manual settings is only offered once. If there are several manually assigned settings at different levels, all of them will be deleted.

The new manual settings (1) will be inherited by all nodes in the tree, overwriting any previous manual settings (2) all the way down to the lowest level children nodes (3) and (4).

**Keep all settings**

If the administrator chooses **Keep all settings**, the new settings will only be applied to the subordinate nodes that don’t have manually applied settings.
If you choose to keep the manually assigned settings, the propagation of the new inherited settings stops at the first manually configured node. Although nodes subordinate to a manually configured node inherit its settings, implementation of the new settings stops at the first node in the tree that has the manual settings. In the figure, the implementation of the settings in (1) stops in node (2), so that nodes (3) and (4) don’t receive the new settings, even though inheritance is being used.

**8.7.5 Deleting manually assigned settings and restoring inheritance**

To delete manually assigned settings to a folder, and restore the settings inherited from a parent node, follow the steps below:

- In the **Computers** menu, click the group with the manually assigned settings to delete in the Groups tree in the panel on the left.
- Click the context menu icon and select **Settings**. A pop-up window will appear with the profiles assigned. Select the manually assigned profile you want to delete.
- A list will appear with all the available profiles that can be assigned manually. At the end of the list you will see the button **Inherit from parent group** along with the settings that will be inherited if you click the button and the group from which they will be inherited.

![Inherit from parent group](image)

The inherited settings will be

Default settings

Inherited from the following group

All

Figure 55: button for deleting manual settings and re-establishing inheritance

### 8.7.6 Moving groups and computers

When you move a group or computer to another branch of the tree, the way **Panda Endpoint Protection / Plus** operates with respect to the settings to apply will vary depending on whether the items moved are complete groups or individual computers.

**Moving individual computers**

In the case of moving individual computers, **Panda Endpoint Protection / Plus** respects the manual settings that are established on the devices moved, and automatically overwrites the inherited settings with the settings established in the new parent group.

**Moving groups**

In the case of moving groups, **Panda Endpoint Protection / Plus** displays a window with the question “Do you want the settings inherited by this computer to be replaced by those in the new group?”

- If you answer **YES**, the process will be the same as with moving computers: the manual settings will be respected and the inherited settings overwritten with those established in the parent node.
- If the answer is **NO**, the manual settings will also be respected but the original inherited settings of the moved group will have priority and as such will become manual settings.

### 8.8. Viewing the assigned settings

The management console offers four methods of displaying the settings profiles assigned to a group or computer:

- From the Groups tree
- From the Settings lists
- From the computer’s **Settings** tab
- From the exported list of computers
Groups tree

To view the settings profiles assigned to a group, click the context menu of the relevant branch in the Groups tree, and select Settings in the pop-up menu displayed.

Figura 56: settings assigned from the Groups tree

Below is a description of the information displayed in this window:

- **Type of settings:**
  - Proxy and language settings
  - Per-computer settings
  - Security settings for workstations and servers
  - Security settings for Android devices

- **Name of the settings:** name given by the administrator when creating the settings.

- **Inheritance type**
  - **Settings inherited from...** The settings were assigned to the specified parent folder. Every computer on the branch inherits them.
  - **Directly assigned to this group:** The settings applied to the computers are those that the administrator assigned to the folder manually.
From the Settings menu

To view the computers and computer groups assigned to a specific settings profile, follow the steps below:

- Go to the Settings menu at the top of the console and select the relevant type of settings from the left-hand side menu.
- Select the relevant settings profile from those available.
- If the settings profile has been assigned to one or more computers or groups, the View computers button will be displayed.

Computer settings tab

In the Computers menu, when you select a computer from the panel on the right, you will see the details screen. The Settings tab will display the list of profiles assigned to the computer.

Exporting the list of computers

From the Computers tree (Groups tree or Filters tree), you can export the list of computers to CSV format by clicking the context menu and selecting Export.

Refer to chapter 7 for a full description of all fields included in the exported CSV file.
9. Agent and local protection settings

- Agent roles
- Internet access via proxy server
- Real-time communication
- Languages
- Anti-Tamper protection and password
9.1. Introduction

Administrators can configure several aspects of the Panda agent installed on the computers on their network:

- Define a computer's role towards the other protected workstations and servers.
- Protect the **Panda Endpoint Protection / Plus** software from unauthorized tampering by hackers and advanced threats (APTs).
- Configure the communication established between the computers on the network and the Panda Security cloud.

9.2. Configuring the Panda agent role

The Panda agent installed on your network computers can have three roles:

- Proxy
- Discovery computer
- Cache

To assign a role to a computer with the Panda agent installed, click the **Settings** menu at the top of the console. Then, click **Network settings** from the menu on the left. Three tabs will be displayed: proxy and language, **Cache** and **Discovery**.

![Figure 58: access to the role settings window](image)

9.2.1 Proxy role

**Panda Endpoint Protection / Plus** allows computers without direct Internet access to use the proxy server installed on the network. If no proxy is accessible, you can assign the proxy role to a computer with **Panda Endpoint Protection / Plus** installed.

![Proxy computers cannot download patches or updates via the Panda Patch Management module. Only computers with direct access to the Panda Security cloud or with indirect access via a corporate proxy can download patches.](image)
Configuring a computer as a proxy server

- Click the **Proxy and language** tab. Select an existing **Proxy and language** settings profile or create a new one.
- Expand the Proxy section and select Panda Endpoint Protection / Plus proxy
- Click **Select computer...**
- In the computer selection window, click Add proxy server. A list will be displayed with all managed computers that haven’t been designated as proxy server yet.
- Select the computers that will act as a proxy server for all other workstations and servers protected by Panda Endpoint Protection / Plus.

Revoking the proxy role

- Click the **Proxy and language** tab. Select an existing **Proxy and language** settings profile or create a new one.
- Expand the Proxy section and select Panda Endpoint Protection / Plus proxy.
- Click **Select computer...**
- Click the 🎥 icon of the computer that you want to stop acting as a proxy.

9.2.2 Cache/repository role

Panda Endpoint Protection / Plus lets you assign the cache role to one or more computers on your network. These computers will automatically download and store all files required so that other computers with Panda Endpoint Protection / Plus installed can update their signature file, agent and protection engine without having to access the Internet. This saves bandwidth as it won’t be necessary for each computer to separately download the updates they need. All updates are downloaded centrally for all computers on the network.

Configuring a computer as a cache

- Click the **Settings** menu at the top of the console. Then, click **Network settings** from the menu on the left and select the **Cache** tab.
- Click **Add cache computer**.
- Use the search tool at the top of the screen to quickly find those computers you want to designate as a cache.
- Select one of more computers from the list and click **OK**

From then on, the selected computer will have the cache role and will start downloading all necessary files, keeping its repository automatically synchronized. All other computers on the same subnet will contact the cache computer for updates.
Revoking the cache role

- Click the **Settings** menu at the top of the console. Then, click **Network settings** from the side menu and click the **Cache** tab.

- Click the **trash** icon of the computer that you want to stop acting as a cache.

Requirements and limitations of computers with the cache role

- The scope of the computer with the cache role is restricted to the network segment to which its network interface is connected. If a cache computer has several network interface cards, it can serve as a repository for each network segment to which it is connected.

- All other computers will automatically discover the presence of the cache node and will redirect their update requests to it.

- A protection license has to be assigned to the cache node in order for it to operate.

- The firewall must be configured to allow incoming and outgoing UPnP/SSDP traffic on UDP port 21226 and TCP port 3128.

Discovery of cache nodes

Computers designated with the cache role broadcast their status to the network segments to which their interfaces connect. All other computers will receive the relevant notification and will connect to the most appropriate node based on the amount of free resources should there be more than one designated cache node on the same network segment.

In addition, network computers will occasionally ask if there is any node with the cache role.

Cache node capacity

The capacity of a cache node is determined by the number of simultaneous connections it can accommodate in high load conditions and by the type of traffic managed (signature file downloads, installer downloads, etc.). Approximately, a computer with the cache role assigned can serve around 1,000 computers simultaneously.

9.2.3 Discovery computer role

The **Discovery** tab is directly related to the installation and deployment of Panda Endpoint Protection / Plus across the customer’s network. Refer to chapter 6 for more information about the Panda Endpoint Protection / Plus discovery and installation processes.
9.3. Configuring Internet access via a proxy server

Configuring proxy usage

To configure the way one or more computers connect to the Internet via a proxy server, you must create a **Proxy and language** settings profile. Follow the steps below:

- Click the **Settings** menu at the top of the console. Then, click **Network settings** from the side menu and click the **Proxy and language** tab.
- Select an existing **Proxy and language** settings profile or create a new one.
- In the **Proxy** section, choose the type of proxy to use.
  - **Do not use proxy**: direct access to the Internet.
  - **Corporate proxy**: access to the Internet via a proxy installed on the company’s network.
  - **Panda Endpoint Protection / Plus proxy**: access via the **Panda Endpoint Protection / Plus** agent installed on a computer on the network.

**Do not use proxy**

Computers without a proxy configured directly access the Panda Security cloud to download updates and send status reports. The **Panda Endpoint Protection / Plus** software communicates with the Internet using the computer settings.

- **Corporate proxy**
  - **Address**: IP address of the proxy server.
  - **Port**: proxy server port.
  - **Proxy requires authentication**: enable it if the proxy requires a user name and password.
  - **User name**
  - **Password**

- **Panda Endpoint Protection / Plus proxy**

This lets you centralize all network communications through a computer with the Panda agent installed.

To configure the sending of data via a **Panda Endpoint Protection / Plus** proxy, click the link **Select computer** to display a list of the available computers that have the proxy role on the network.

*UDP port 21226 and TCP port 3128 on computers designated as a Panda Endpoint Protection / Plus proxy cannot be used by other applications. Additionally, the computer’s firewall must be configured to allow incoming and outgoing traffic on both ports.*
**Fallback mechanism**

When a Panda agent cannot connect to the Aether platform, the following fallback logic is applied to restore the connection via other means:

- If the Internet connection is configured via corporate proxy or Panda Endpoint Protection / Plus proxy and there is no response, an attempt is made to connect directly.
- Internet Explorer: the Panda agent tries to recover the Internet Explorer proxy settings with the profile of the user logged in to the computer.
  - If the configuration of the proxy credentials is defined explicitly, this method can’t be used.
  - If the Internet Explorer proxy settings use PAC (Proxy Auto-Config) the URL is obtained from the settings file, provided that the protocol is HTTP or HTTPS.
- WinHTTP / WinInet: the default proxy settings are read.
- WPAD (Web Proxy Auto-discovery Protocol): a request is sent to the network via DNS or DHCP to get the URL that points to the PAC settings file.

9.4. Configuring real-time communication

Real-time communication between your protected computers and the Panda Endpoint Protection / Plus server requires that each computer have an open connection at all times. However, in those organizations where the number of open connections may have a negative impact on the performance of the installed proxy, it may be advisable to disable real-time communication. The same applies to those organizations where the traffic generated when simultaneously deploying configuration changes to a large number of computers may impact bandwidth usage.

**Disabling real-time communication**

- Click the Settings menu at the top of the console. Then, click Network settings from the side menu and click the Proxy and language tab.
- Select an existing Proxy and language settings profile or create a new one.
- In the Proxy section, click the Advanced options link.
- Clear the Enable real-time communication checkbox.

If you disable real-time communication, your computers will communicate with the Panda Endpoint Protection / Plus server every 15 minutes.

9.5. Configuring the agent language

To set up the language of the Panda agent for one or more computers, create a Proxy and language settings profile. Follow the steps below:
- Click the Settings menu at the top of the console. Then, click Network settings from the side menu and click the Proxy and language tab.

- Select an existing Proxy and language settings profile or create a new one.

- Select a language from the list:
  - English
  - Spanish
  - Swedish
  - French
  - Italian
  - German
  - Portuguese
  - Hungarian
  - Russian
  - Japanese
  - Finnish (local console)

If the language is changed while the Panda Endpoint Protection / Plus local console is open, the system will prompt the user to restart the console. This process does not affect the security of the computer.

9.6. Configuring the Anti-Tamper protection and password

9.6.1 Anti-Tamper protection

Many advanced threats and hackers take advantage of sophisticated techniques to disable the security software installed on computers and bypass protection features. To stop that, Panda Endpoint Protection / Plus incorporates anti-tamper technologies that prevent unauthorized tampering of the solution.

Enabling the Anti-Tamper protection

- Click the Settings menu at the top of the console. Then, click Per-computer settings from the side menu.

- Click an existing settings profile or click Add to create a new one.

- Expand section Security against unauthorized protection tampering:

  - Enable Anti-Tamper protection (prevents users and certain types of malware from stopping the protections). Enabling this option requires setting up a password, which will be required if, for example, the administrator or a support team member needs to temporary disable the protection from the local computer in order to diagnose a problem.
9.6.2 Password-protection of the agent

Administrators can set up a password to prevent users from changing the protection features or completely uninstalling the Panda Endpoint Protection / Plus software from their computer.

Setting up the password

- Click the Settings menu at the top of the console. Then, click Per computer settings from the side menu.
- Click an existing settings profile or click Add to create a new one.
- Expand section Security against unauthorized protection tampering:
  - Request password to uninstall Panda agent from computers: this is to prevent users from uninstalling the Panda Endpoint Protection / Plus software.
  - Allow the protections to be temporarily enabled/disabled from the computers' local console: this allows administrators to manage a computer's security from its local console. Enabling this option requires setting up a password.
10. Security settings for workstations and servers

Introduction to the security settings for workstations and servers

General settings
   Antivirus
   Firewall
   Device Control
   Web Access Control
   Antivirus for Exchange servers
   Anti-Spam for Exchange servers
   Content Filtering for Exchange servers
10.1. Introduction

**Panda Endpoint Protection / Plus Settings** menu provides access to the parameters required to configure the security settings for workstations and servers. Click the **Workstations and servers** section from the left-hand menu to display a list of the security configurations already created.

This chapter describes the available parameters to configure the security settings for workstations and servers. It also includes practical recommendations on how to protect all computers on your network, without negatively impacting users' activities.

10.2. Introduction to the security settings for workstations and servers

The parameters for configuring the security of workstations and servers are divided into eight sections. Clicking each section displays a drop-down panel with the associated options. Below we offer a brief explanation of each section:

- **General**: lets you configure the updates, the removal of competitor products, and file exclusions from scans.
- **Antivirus**: lets you configure the general parameters that control the traditional anti-malware protection against viruses and threats.
- **Firewall (Windows devices)**: lets you configure the general parameters that control the firewall and IDS against network attacks.
- **Device Control (Windows devices)**: lets you configure the general parameters that control user access to the peripheral devices connected to their computers.
- **Web Access Control (Panda Endpoint Protection Plus only)**: lets you restrict access to certain Web content categories.
- **Antivirus for Exchange servers (Panda Endpoint Protection Plus only)**: scans the inbound and outbound email that goes through your Exchange mail servers, searching for threats.
- **Anti-Spam for Exchange servers (Panda Endpoint Protection Plus only)**: scans the inbound and outbound email that goes through your Exchange mail servers, searching for unwanted email.
- **Content Filtering for Exchange servers (Panda Endpoint Protection Plus only)**: restricts the content types that can reach your Exchange servers.

10.3. General settings

The general settings let you configure how Panda Endpoint Protection / Plus behaves regarding updates, the removal of competitor products, and file and folder exclusions from the scans performed by the traditional antivirus.

10.3.1 Updates

Refer to chapter 13 Software updates for more information about how to update the agent, the protection, and the software signature file installed on users' computers.

10.3.2 Uninstall other security products

Refer to chapter 6 Installing the Panda Endpoint Protection / Plus software for more information about what to do with competitor products when installing Panda Endpoint Protection / Plus.

Refer to Appendix 3: list of uninstallers for a list of the competitor products that Panda Endpoint Protection / Plus can automatically uninstall from users' computers.

10.3.3 Exclusions

The Exclusions section lets you select the computer items that won't be scanned for malware.

Disk files

Lets you select the files on the hard disk of protected computers that won't be scanned by Panda Endpoint Protection / Plus.

- Extensions: lets you specify file extensions that won't be scanned.
- Folders: lets you specify folders whose content won't be scanned.
- Files: lets you indicate specific files that won't be scanned.
- Recommended exclusions for Exchange servers: click Add to automatically load a series of Microsoft-recommended exclusions to optimize the performance of Panda Endpoint Protection / Plus on Exchange servers.
Exclude the following email attachments:
Lets you specify the extensions of email file attachments that Panda Endpoint Protection / Plus won’t scan.

10.4. Antivirus

This section lets you configure the general behavior of the signature-based antivirus engine.

- **File protection**: enable/disable the antivirus protection for the file system.
- **Email protection**: enable/disable the antivirus protection for the mail client installed on users’ computers.
- **Web browsing protection**: Enable/disable the antivirus protection for the Web client installed on users’ computers.

The action taken by Panda Endpoint Protection / Plus when finding a malware or suspicious file is defined by Panda Security's anti-malware laboratory, and is based on the following criteria:

- **Files identified as malware if disinfection is possible**: they are disinfected. The original file is deleted and replaced with a harmless, disinfected copy.
- **Files identified as malware when disinfection is not possible**: if disinfection is not possible, the solution makes a backup copy of the infected file and the original file is deleted.

10.4.1 Threats to detect

Lets you configure the types of threats that Panda Endpoint Protection / Plus will search for and remove from the file system, mail client and Web client installed on users’ computers.

- **Detect viruses**
- **Detect hacking tools and PUPs**
- **Block malicious actions**: enables a set of anti-exploit technologies that scan the behavior of local processes, looking for suspicious activity.
- **Detect phishing**

10.4.2 File types

This section lets you specify the types of files to be scanned by Panda Endpoint Protection / Plus:

- **Scan compressed files on disk**
- **Scan compressed files in emails**
- **Scan all files regardless of their extension when they are created or modified (Not recommended)**: to enhance efficiency and performance, we recommend that you don’t scan all types of files as many types of data files actually don't pose a threat to the security of the network.
10.5. Firewall (Windows devices)

Panda Endpoint Protection / Plus provides three basic tools to filter the network traffic that protected computers send and receive:

- **System rules**: these rules describe communication characteristics (ports, IP addresses, protocols etc.) in order to allow or deny the data flows that match the configured rules.
- **Program rules**: rules that allow or prevent the programs installed on users' computers from communicating.
- **Intrusion detection system**: detects and rejects malformed traffic patterns that can affect the security or performance of protected computers.

10.5.1 Operational mode

There are two operational modes for the firewall, which can be defined through the **Let computer users configure the firewall** option:

- **Enabled** (user-mode or self-managed firewall): this option allows end users to manage the firewall protection from the local console installed on their computers.
- **Disabled** (administrator-mode firewall): the administrator configures the firewall protection of every computer on the network through configuration profiles.

10.5.2 Network type

Laptops and mobile devices can connect to networks with different security levels, from public Wi-Fi networks, such as those in Internet cafés, to managed and limited-access networks, such as those found in companies. To set the firewall's default behavior, the network administrator must select the type of network that the computers in the configured profile usually connect to.

- **Public network**: these are the networks found in Internet cafés, airports, etc. They have limitations on the way protected computers are used and accessed, especially with regard to file, resource and directory sharing.
- **Trusted network**: these are office and home networks. Your computer is perfectly visible to the other computers on the network. Additionally, there are no limitations on sharing files, resources or directories.

Panda Endpoint Protection / Plus will behave differently and will apply different predetermined rules depending on the type of network. You can view these predetermined rules (Panda rules) in the **Program rules** and **Connection rules** sections.

10.5.3 Program rules

This section lets you configure which programs can communicate with the local network/Internet, and which cannot.

To build an effective protection strategy it is necessary to follow the steps below in the order listed:
1  Set the default action

- **Allow**: Implements a permissive strategy based on always accepting connections for all programs for which you haven't configured a specific rule in step 3. This is the default, basic mode.

- **Deny**: implements a restrictive strategy based on always denying connections for all programs for which you haven't configured a specific rule in step 3. This is an advanced mode, as it requires adding rules for every frequently used program. Otherwise, those programs will not be allowed to communicate, affecting their performance.

2  Enable Panda's rules

Enables Panda Security's predefined rules for the selected network type.

3  Add rules to define the specific behavior of your applications

Change the order of the program rules, add, edit or remove them by using the Up (1), Down (2), Add (3), Edit (4) and Delete (5) buttons on the right. The checkboxes (6) will let you select the rules to apply each action to.

The following fields are mandatory when you are creating a rule:

- **Description**
- **Program**: lets you select the program whose behavior you want to control.
- **Connections allowed for this program**:
  - **Allow inbound and outbound connections**: the program can connect to the Internet/local network and allows other programs or users to connect to it. There are certain types of programs that need these permissions to work correctly: file sharing programs, chat applications, Internet browsers, etc.
  - **Allow outbound connections**: the program can connect to the Internet/local network, but won't accept inbound connections from other users or applications.
  - **Allow inbound connections**: the program accepts connections from programs or users from the Internet/local network, but won't be allowed to establish outbound connections.
  - **Deny all connections**: the program cannot connect to the Internet or local networks.
- **Advanced permissions**:
  - **Action**: defines the action that **Panda Endpoint Protection / Plus** will take if the examined traffic matches the rule.
    - **Allow**: allows the traffic.
    - **Deny**: blocks the traffic. It drops the connection.
- **Direction**: sets the traffic direction for connection protocols such as TCP.
  - **Outbound**: traffic from the user's computer to another computer on the network.
  - **Inbound**: traffic to the user's computer from another computer on the network.

- **Zone**
- **Protocol**: Lets you establish the layer 3 protocol for the traffic generated by the program you want to control.
  - **All**
  - **TCP**
  - **UDP**

- **IPs**
  - **All**: the rule doesn't take into account the connection's source and destination IP addresses.
  - **Custom**: lets you specify the source and destination IP addresses of the traffic to control. You can enter multiple addresses separated by commas (,). To specify a range, use a hyphen (-).

- **Ports**: lets you specify the communication port. Select **Custom** to enter multiple ports separated by commas (,). To specify a range, use a hyphen (-).

### 10.5.4 Connection rules

This section lets you define traditional TCP/IP traffic filtering rules. *Panda Endpoint Protection / Plus* compares the value of certain fields in the headers of each packet sent and received by the protected computers, and checks it against the rules entered by the administrator. If the traffic matches any of the rules, the associated action is taken.

Connection rules affect the entire system (regardless of the process that manages them). They have priority over the program rules that govern the connection of your programs to the Internet/local network.

To build an effective strategy to protect the network against dangerous and unwanted traffic, it is necessary to follow the steps below in the order listed:

1. **Specify the firewall's default action in the Program rules section**
   - **Allow**: implements a permissive strategy based on always accepting all connections for which you haven't configured a specific rule in step 3. This is the default, basic mode: all connections for which there is not an existing rule will be automatically accepted.
   - **Deny**: implements a restrictive strategy based on always denying all connections for which you haven't configured a specific rule in step 3. This is an advanced mode: all connections for which there is not an existing rule will be automatically denied.

2. **Enable Panda's rules**

   Enables Panda Security's predefined rules for the selected network type.
3 Add rules that describe specific connections along with the associated action

Change the order of the connection rules, add, edit or remove them by using the Up (1), Down (2), Add (3), Edit (4) and Delete (5) buttons on the right. The checkboxes (6) will let you select the rules to apply each action to.

The order of the rules on the list is important. They are applied in descending order, therefore, if you change the position of a rule, you will also change its priority.

Next, we describe the fields found in a connection rule:

- **Name**
- **Description**
- **Action**: indicates the action that Panda Endpoint Protection / Plus will take if the examined traffic matches the rule.
  - **Allow**: allows the traffic.
  - **Deny**: blocks the traffic. It drops the connection.
- **Direction**: specifies the direction of the traffic for connection protocols such as TCP.
  - **Outbound**: outbound traffic.
  - **Inbound**: inbound traffic.
- **Zone**
- **Protocol**: lets you specify the rule protocol. The options displayed will vary depending on the option you select:
  - **TCP, UDP, TCP/UDP**: lets you define TCP and/or UDP rules, including local and remote ports.
    - **Local ports**: lets you specify the connection port used on the user's computer. Select **Custom** to enter multiple ports separated by commas (,). To specify a range, use a hyphen (-).
    - **Remote ports**: lets you specify the connection port used on the remote computer. Select **Custom** to enter multiple ports separated by commas (,). To specify a range, use a hyphen (-).
  - **ICMP**: lets you create rules that describe ICMP messages, along with their type and subtype.
  - **IP Types**: lets you create rules for the IP protocol and other higher-level protocols.
- **IP addresses**: lets you specify the traffic's source and destination IP addresses.
- **MAC addresses**: lets you specify the traffic's source and destination MAC addresses.
The source and destination MAC addresses are overwritten every time the traffic goes through a proxy, router, etc. Therefore, the data packets will reach their destination with the MAC address of the last device that handled traffic.

10.5.5 Block intrusions

The intrusion detection system (IDS) allows administrators to detect and reject malformed traffic specially crafted to impact the security and performance of the computers to protect. This traffic type may cause malfunction of user programs and lead to serious security issues, allowing remote execution of user applications by hackers, data theft, etc.

Panda Endpoint Protection / Plus provides protection against 15 types of generic patterns. This protection can be enabled and disabled by selecting and clearing the relevant checkboxes. Next is a description of the types of malformed traffic supported and the protection provided:

- **IP Explicit Path**: rejects IP packets that contain an explicit source route field. These packets are not routed based on their target IP address, but the routing information is defined beforehand.

- **Land Attack**: stops denial-of-service attacks that use TCP/IP stack loops by detecting packets with identical source and target addresses.

- **SYN Flood**: this attack launches TCP connection attempts massively to force the targeted computer to commit resources for each connection. The protection establishes a maximum number of open TCP connections to prevent the computer under attack from becoming saturated.

- **TCP Port Scan**: detects if a host tries to connect to several ports on the protected computer in a specific time period. The solution filters both the requests to open ports and the replies to the malicious computer. This prevents the attacking computer from obtaining information about the status of the ports.

- **TCP Flags Check**: detects TCP packets with invalid flag combinations. It acts as a complement to the protection against port scanning by blocking attacks of that type such as "SYN&FIN" and "NULL FLAGS". It also complements the protection against OS fingerprinting attacks as many of these are based on replies to invalid TCP packets.

- **Header Lengths**
  - **IP**: rejects inbound packets with an IP header length that exceeds a specific limit.
  - **TCP**: rejects inbound packets with a TCP header length that exceeds a specific limit.
  - **Fragmentation overlap**: checks the status of the packet fragments to be reassembled at the destination, protecting the system against memory overflow attacks due to missing fragments, ICMP redirects masked as UDP, and computer scanning.

- **UDP Flood**: rejects UDP streams to a specific port if the number of UDP packets exceeds a preconfigured threshold in a particular period.

- **UDP Port Scan**: protects the system against UDP port scanning attacks.

- **Smart WINS**: rejects WINS replies that do not correspond to requests sent by the computer.

- **Smart DNS**: rejects DNS replies that do not correspond to requests sent by the computer.

- **Smart DHCP**: rejects DHCP replies that do not correspond to requests sent by the computer.
- **ICMP Attack**: this filter performs various checks:
  - **Small PMTU**: by inspecting ICMP packets, the protection detects invalid MTU values used to generate a denial-of-service attack or slow down outbound traffic.
  - **SMURF**: the attack involves sending large amounts of ICMP (echo request) traffic to the network broadcast address with a source address spoofed to the victim's address. Most computers on the network will reply to the victim, multiplying traffic flows. The protection rejects unsolicited ICMP replies if they exceed a certain threshold in a specific time period.
  - **Drop unsolicited ICMP replies**: rejects all unsolicited ICMP replies and ICMP replies that have expired due to timeout.
  - **ICMP Filter echo request**: the solution rejects ICMP echo request packets.
  - **Smart ARP**: rejects ARP replies that do not correspond to requests sent by the protected computer to avoid ARP cache poisoning scenarios.
  - **OS Detection**: falsifies data in replies to the sender to trick operating system detectors. It prevents attacks aimed at taking advantage of vulnerabilities associated with the operating system detected. This protection complements the TCP Flag Checker.

### 10.6. Device Control (Windows devices)

Popular devices like USB flash drives, CD/DVD drives, imaging and Bluetooth devices, modems and smartphones can become a gateway for infections.

The Device Control feature lets you configure the way the protected computer will behave when connecting or using a removable or mass storage device. Select the device or devices you want to authorize or block, and specify their usage.

Follow the steps below to enable the Device Control feature:

- Select the **Enable device control** checkbox (1).
- From the drop-down menu, select the authorized usage level for each type of device (2)
  - In the case of USB flash drives and CD/DVD drives, you can choose among **Block**, **Allow read access** or **Allow read & write access**.
  - The options available for Bluetooth and imaging devices, USB modems and smartphones are **Allow** and **Block**.

#### 10.6.1 Allowed devices

Sometimes, you may need to block a certain category of devices but allow the use of some specific devices belonging to that category.

In that case you can create a whitelist, that is, a list of devices that will be allowed despite belonging to an unauthorized category.
Panda Endpoint Protection / Plus lists all devices connected to each computer. Click the icon in the **Allowed devices** section to display the list of all devices connected to the computers on your network. Use this list to select those devices that you want to exclude from the general block rules defined for each type of device. Finally, use the button to delete existing exclusions.

### 10.6.2 Exporting/importing a list of allowed devices

Once you have finished configuring your list of allowed devices, you can export it to a text file. You can also do the opposite, that is, create a text file with the devices that you want to allow, and import it to the Panda Endpoint Protection / Plus Web console.

To export and import exclusion lists, use the **Export** and **Import** options from the context menu.

### 10.6.3 Obtaining a device's unique ID

If you want to exclude a device from the Device Control feature without having to wait for the user to connect it and then exclude it manually, obtain the device's ID. To do this, follow the steps below:

- In the Windows Device Manager, access the properties of the USB device that you want to identify in order to exclude it.
- Go to the Details tab and select Resources from the Property menu. A value called `CM DEVCAP UNIQUED` should be displayed.
- Next, select Device Instance Path from the Property menu to obtain the device's unique ID.
If no CM\_DEVCAP\_UNIQUEID value is displayed, it will not be possible to identify the device uniquely. You will have to use the device’s hardware ID to identify it.

In the Property menu, select Hardware ID. This value will allow you to exclude every USB device of the same model as the one you have identified, as it won’t be possible to differentiate one specific device from the others.

Once you have the unique IDs of all the devices that you want to allow, you can create your whitelist and import it as explained in the previous section.

### 10.7. Web Access Control

Feature only available in Panda Endpoint Protection Plus.

This protection allows network administrators to limit access to specific Web categories, and configure a list of URLs to allow and deny access to. This module enables companies to optimize network bandwidth and increase business productivity.

To enable and disable it, click the **Enable Web access control** option.

#### 10.7.1 Configuring time periods for the Web Access Control feature

This option allows you to limit access to certain Web page categories and blacklisted sites during business hours, and authorize it during non-business hours and weekends.

To configure Internet access time limits, select the **Enable only during the following times** option.

Next, select the times at which you want the Web Access Control to be enabled. To enable it only during certain times, select the relevant box and use the time grid to select the times that you want.

- To select whole days, click the relevant day of the week.
- To select the same time period for every day of the week, click the relevant hours.
- To select every day of the month, click the **Select all** button.
- To deselect your selection and start over, click the **Clear** button.

#### 10.7.2 Denying access to specific Web pages

Panda Endpoint Protection / Plus groups Web pages into 64 categories. All you have to do is select those categories that you want to deny access to.
Use the available category list to do so. If a user visits a Web page that belongs to one of the forbidden categories, a warning Web page will be displayed indicating that access is denied and the reason.

**Denying access to pages categorized as unknown**

You can deny access to pages categorized as unknown simply by selecting the relevant checkbox.

Bear in mind that internal and intranet sites accessible on ports 80 and 8080 may be categorized as unknown, resulting in users not being able to access them. To avoid this, you can add any pages you want to the exclusion whitelist explained below.

10.7.3 **List of allowed/denied addresses and domains**

You can set a list of pages that will always be allowed (whitelist) or blocked (blacklist), regardless of the category that they belong to.

You can edit these lists at any time.

- Enter the URL of the relevant address or domain in the text box.
- Click **Add**.
- Use the **Delete** and **Clear** buttons to edit the list according to your needs.
- Finally, click **OK** to save the settings.

As soon as a website coincides with one of the whitelisted/blacklisted sites (either wholly or partially), it will be allowed/blocked. In the case of long URLs, it will be enough to enter the beginning of the URL in the appropriate box.

10.7.4 **Database of all URLs accessed from computers**

Each computer on the network keeps a database of the URLs accessed from it. This database can only be consulted locally, that is, on each computer itself, for a period of 30 days.

The data displayed is as follows:

- User ID
- Protocol (HTTP or HTTPS)
- Domain
- URL
- Returned category
- Action (Allow/Deny)
- Date accessed
- Access counter (by category and domain)
10.8. Antivirus for Exchange servers

Provided you have the necessary licenses, you'll be able to enable the protection for Exchange servers from the management console, and assign licenses to any Exchange server on your network. The protection for Exchange servers supports Exchange 2003, 2007, 2010, 2013 and 2016, and consists of the following three modules:

- Antivirus
- Anti-spam
- Content filter

Additionally, and depending on the moment when Panda Endpoint Protection / Plus scans the email traffic, we can differentiate between two protection modes: mailbox protection and transport protection.

Tabla 13 shows the Exchange versions supported by each protection module and scan mode.

<table>
<thead>
<tr>
<th>Scan mode/Protection module</th>
<th>Antivirus</th>
<th>Anti-Spam</th>
<th>Content Filtering</th>
</tr>
</thead>
</table>

Tabla 13: Exchange versions supported by each protection module and scan mode

10.8.1 Configuring the antivirus protection based on the scan mode

The protection for Exchange servers lets you choose between two types of scans:

- Mailbox protection
- Transport protection

Mailbox protection

This protection is used on Exchange servers with the Mailbox role, and scans folders/mailboxes in the background or when messages are received and stored in users' folders.

The mailbox protection is only available in the Antivirus module for Exchange 2003, 2007 and 2010.
Transport protection
This protection is used on Exchange servers with the Client Access, Edge Transport and Hub Transport server roles, and scans the traffic that goes through the Exchange server.

It scans for viruses, hacking tools and suspicious/potentially unwanted programs sent to the Exchange Server mailboxes.

You can enable/disable the mailbox and/or the transport protection by clicking the relevant checkboxes.

Mailbox protection
The mailbox protection behaves differently depending on whether the Exchange server is Exchange Server 2013-2016 or a different version.

Exchange 2013-2016 does not allow message manipulation. That is, if a message contains a dangerous item, the entire message will be moved to quarantine. In such a case, the end user protected with **Panda Endpoint Protection / Plus** will receive a message with the original subject but the message body replaced with a warning text. This text will prompt the user to contact the network administrator to recover the original message.

With all other versions of Exchange Server, **Panda Endpoint Protection / Plus** will take the action defined by Panda Security when a malware item is detected: disinfect the attachment if disinfection is possible, or send it to quarantine if disinfection is not possible. That is, the end user will receive the original message with the clean attachments or, if disinfection is not possible, a replacement file called “security_alert.txt” with information about the reason for the detection.

10.8.2 Software to detect
Select the relevant options to detect different types of threats:

- Detect viruses
- Detect hacking tools and PUPs

10.8.3 Intelligent mailbox scan
The intelligent mailbox scan runs during periods of low server activity, scanning the email messages stored on the organization's Exchange server. Moreover, it only scans those files that have not been previously scanned with the downloaded signature file. Every time there is an update of the signature file, **Panda Endpoint Protection / Plus** will automatically launch a new intelligent mailbox scan.

10.8.4 Restoring messages with viruses and other threats
Configure the SMTP server that will forward the messages restored from the management console by entering the required information:
- **SMTP server**: enter the mail server's IP address or domain.
- **This server requires authentication**: select this option if the SMTP server is not an open relay.
- **User**
- **Password**

If you don't configure an SMTP server, the messages will be restored to a folder on the Exchange server's hard drive.

### 10.9. Anti-spam for Exchange servers

Use the **Detect spam** button to enable or disable this protection.

Upon enabling the anti-spam protection, *Panda Endpoint Protection / Plus* will show a pop-up message offering the possibility to add a series of exclusion rules to improve the performance of your mail servers.

#### 10.9.1 Actions to perform on spam messages

Specify what to do with spam messages:

- **Let the message through**: the tag *Spam* will be added to the subject line of the message. This is the default option.
- **Move the message to...**: You will have to specify the email address that the message will be moved to. In addition, the tag *Spam* will be added to the subject line of the message.
- **Delete the message**
- **Flag with SCL (Spam Confidence Level)**

**SCL**

The Spam Confidence Level (SCL) is a value from 0 to 9 assigned to all messages that indicates the likelihood that a message is spam. A value of 9 indicates an extremely high likelihood that a message is spam. 0 is assigned to messages that are not spam. The SCL value can be used to configure a threshold in Active Directory above which you consider a message to be spam. The solution will flag all messages with the relevant SCL value and let them through.

Then, the administrator will establish the action to be taken on each message based on the threshold set in Active Directory.
10.9.2 **Allowed addresses and domains**

This is a whitelist of trusted email addresses and domains whose messages won’t be scanned by the anti-spam protection.

If you want to specify more than one address/domain, separate them with ",".

10.9.3 **Spam addresses and domains**

This is a blacklist of email addresses and domains whose messages will be intercepted and deleted by the protection.

Keep in mind the following aspects when configuring these lists:

- If a domain is blacklisted but an address in the domain is whitelisted, the address will be allowed. However, all other addresses in the domain will be blocked.
- If a domain is whitelisted but an address in the domain is blacklisted, that address will be blocked. However, all other addresses in the domain will be allowed.
- If a domain (e.g.: domain.com) is blacklisted and one of its subdomains (e.g.: mail1.domain.com) is whitelisted, the addresses in the subdomain will be allowed. However, all other addresses in the domain or in any other of its subdomains will be blocked.
- If a domain is whitelisted, all subdomains in the domain will also be whitelisted.

10.10. **Content Filtering for Exchange servers**

**Feature only available in Panda Endpoint Protection Plus.**

The Content Filtering feature allows administrators to filter email messages based on the extension of their attachments.

Once you have set a list of potentially dangerous files, configure the action to take on them.

You can also filter email attachments with double extensions.

- **Action to take**: select whether you want to delete files with dangerous attachments or move them to a specific folder. This can very helpful if you want to analyze those files at a later stage.
- **Consider attachments with the following extensions dangerous**: enter the extensions of those files you want to consider dangerous. You can use the *Add, Delete, Clear* and *Restore* buttons to configure the list to your needs.
- **Consider attachments with double extensions dangerous, except for the following**: select this option to block all messages containing files with double extensions, except for the ones you allow. Use the *Add, Delete, Clear* and *Restore* buttons to configure the list of double extensions to allow.
Detection log

All detections that take place on an Exchange server are logged locally in a CSV file. This allows network administrators to obtain additional information when a message does not reach the intended recipient.

This file is called ExchangeLogDetections.csv and can be found in the following folder:

%AllUsersProfile%\Panda Security\Panda Cloud Office Protection\Exchange

The CSV file contains the following fields arranged in a tabular form:

- **Date**: date when the message arrived at the Exchange server.
- **From**
- **To**
- **Subject**
- **Attachments**: list of message attachments.
- **Protection**
- **Action**
11. Android security settings

Settings for Android devices
Updates
Antivirus
11.1. Introduction

Panda Endpoint Protection / Plus’s Settings menu provides the parameters required to configure the security settings for smartphones and tablets. Click the Android devices panel on the left-hand menu to display a list of the security configurations already created.

This chapter explains the available security settings for Android devices and gives recommendations to protect smartphones and tablets.

11.2. Introduction to the security settings for Android devices

The settings options for Android devices are divided into three sections. Click each of them to display a drop-down menu with the associated options. Below we offer a brief explanation of each section:

- **Updates**: lets you define the type of connection to be used by the device to download updates from Panda Security's cloud.

- **Antivirus**: lets you configure the antivirus protection.

11.3. Updates

The update options are described in chapter 13 Software updates.

11.4. Antivirus

The antivirus protection for Android devices protects smartphones and tablets against the installation of malware-infected apps and PUPs, scanning both your devices and their SD memory cards on access and on demand.

Select the Enable permanent antivirus protection checkbox to enable malware detection.

**Exclusions**

The Android protection allows you to exclude any of the installed apps from the scans. To do that, enter the names of the packages to exclude, separated with commas.

To look up an app's package name, find the app in the Google Play app store using a Web browser. The package name will be listed at the end of the URL after the '?id='.
12. Panda Patch Management (Updating vulnerable programs)

General workflow
Discovery of missing patches
Panels and Widgets
Lists
Downloading and installing patches
12.1. Introduction

Panda Patch Management is a built-in module on Aether Platform that finds those computers on the network with known software vulnerabilities and updates them centrally and automatically. It minimizes the attack surface, preventing malware from taking advantage of the software flaws that may affect the organization’s workstations and servers in order to infect them.

Panda Patch Management supports Windows operating systems. It detects both third-party applications with missing patches or in EOL (End-Of-Life) stage, as well as all patches and updates published by Microsoft for all of its products (operating systems, databases, Office applications, etc.).

Windows XP SP3 and Windows Server 2003 SP2 computers require a computer with the cache/repository role on the same subnet in order to detect and install missing patches. Windows XP SP3 and Windows Server 2003 SP2 computers cannot download patches even if they have the cache/repository role assigned.

The features provided by Panda Patch Management are accessible via the following sections in the management console:

- **To configure the discovery of missing patches**: go to the Patch management settings section (top menu Settings, side panel).
- **To have visibility into the update status of the entire IT network**: go to the Patch management dashboard (top menu Status, side panel).
- **To view lists of missing patches**: check the Patch management status, Available patches and End-of-Life programs lists (top menu Status, side panel My lists, Add).
- **To view a history of all installed patches**: check the Installation history list (top menu Status, side panel My lists, Add).
- **To patch computers**: go to top menu Tasks, and create an Install patches scheduled task. You can also patch computers via the context menus available in the group tree (top menu Computers), on the lists, and on the Computer details screen.
- **To uninstall patches**: select one of the following options:
  - From the Last patch installation tasks widget, click the View installation history link.
  - Go to the Status menu at the top of the console, click Add in the My lists section of the side panel and select the Installation history list.
  - Go to the Tasks menu at the top of the console, select the task that installed the patch to uninstall and click View installed patches.

Click the patch to uninstall. A screen will be displayed with the patch details and the Uninstall button if the patch supports this option.
12.2. General workflow

Panda Patch Management is a comprehensive tool for patching and updating the operating systems and all programs installed on the computers on your network. To effectively reduce the attack surface of your computers, follow the steps below:

- Make sure Panda Patch Management works properly on the protected computers on your network.
- Make sure that all published patches are installed.
- Install the selected patches.
- Uninstall any patches that are causing malfunction problems (rollback).
- Make sure the programs installed on your computers are not in EOL (End-Of-Life) stage.
- Regularly check the history of patch and update installations.
- Regularly check the patch status of those computers where incidents have been recorded.

12.2.1 Make sure that Panda Patch Management works properly

Follow the steps below:

- Make sure that all computers on your network have a Panda Patch Management license assigned and the module is installed and running. Use the Patch management status widget.
- Make sure that all computers with a Panda Patch Management license assigned can communicate with the Panda Security cloud. Use the Time since last check widget.
- Make sure the computers that will receive the patches have the Windows Update service running with automatic updates disabled.

We advise that you disable automatic updates in the Windows Update service settings so that Panda Patch Management can control when to apply patches. Otherwise, Windows Update will overlap with Panda Patch Management. Regardless of these settings, certain Microsoft patches require that Windows Update be running.

12.2.2 Make sure that all published patches are installed

As software vendors discover flaws in their products, they publish updates and patches that must be installed on the affected systems in order to fix them. These patches have a criticality level and type associated to them:

- To view missing patches by type and criticality level, use the Patch criticality widget.
- To view details of the patches that are missing on a computer or computer group:

  • Go to the computer tree (top menu Computers, Folder tab in the side panel), and click the context menu of a computer group containing Windows computers. Select View available patches. The Available patches list will be displayed filtered by the relevant group.

  Or,
• Go to the computers screen (top menu **Computers**, right panel) and click a computer's context menu. Select **View available patches**. The **Available patches** list will be displayed filtered by the relevant computer.

- To get an overview of all missing patches:
  • Go to top menu **Status**, click **Add** in the **My list** section of the side panel and select the **Available patches** list.
  • Use the filter tool to narrow your search.

- To find those computers that don't have a specific patch installed:
  • Go to top menu **Status**, click **Add** in the **My list** section of the side panel and select the **Available patches** list.
  • Use the filter tool to narrow your search.
  • Click the context menu of the specific computer-patch and select the option **View which computers have the patch available**.

### 12.2.3 Install the patches

Patches and updates are installed via quick tasks and scheduled tasks. Quick tasks install patches in real time but do not restart the target computer, even though this may be required in order to complete the installation process. Scheduled tasks allow you to configure all parameters related to the patch installation operation. Refer to chapter 14 Tasks for more information about tasks in **Panda Endpoint Protection / Pro**.

Despite the management console is a very flexible tool that allows you to install patches in multiple ways, generally speaking you can apply the following strategies:

- To install one or multiple specific patches, use the **Available patches** list and configure the filter tool.
- To install all patches of a certain type or with a specific criticality level, use a quick or schedule task.
- To install patches on a specific computer or computer group, use the group tree.

Next is a description of all possible combinations of patches and targets, along with the steps to take to complete the patch operation.

<table>
<thead>
<tr>
<th>Target / Patch</th>
<th>One or multiple specific patches</th>
<th>One, multiple or all types of patches</th>
</tr>
</thead>
<tbody>
<tr>
<td>One or multiple computers</td>
<td>Available patches list (1)</td>
<td>Tasks (1)</td>
</tr>
<tr>
<td><strong>A group</strong></td>
<td>Available patches list (2)</td>
<td>Tasks (2)</td>
</tr>
<tr>
<td><strong>Multiple or all groups</strong></td>
<td>Available patches list (3)</td>
<td>Tasks (3)</td>
</tr>
</tbody>
</table>

Table 14: patch installation based on the target and the patches to install
Available patches list (1)

Follow these steps to install one or multiple specific patches on one or multiple computers:

- Go to top menu Status, click Add in the My list section of the side panel and select the Available patches list.
- Use the filter tool to narrow your search.
- Click the checkboxes besides the computers-patches you want to install, and select Install from the action bar to create a quick task, or Schedule installation to create a scheduled task.

Tasks (1)

Follow these steps to install one, multiple or all types of patches on one or multiple computers:

- Go to top menu Computers and click the Folders tab in the computer tree (left panel). Next, select the group that the target computers belong to. If the target computers belong to multiple groups, click the All root group.
- Click the checkboxes besides the computers that the patches will be applied to.
- From the action bar, click Schedule patch installation.
- Configure the task, click the Save button and publish it.

Available patches list (2)

Follow these steps to install a specific patch on a computer group:

- Go to top menu Computers and click the Folders tab in the computer tree (left panel). Next, click the group’s context menu.
- Click the View available patches option. The Available patches list will be displayed filtered by the relevant group.
- Use the Patch field in the filter tool to list only the patch to install.
- Select all computers on the list by clicking the relevant checkboxes.
- Click Install from the action bar to create a quick task, or Schedule installation to create a scheduled task.

To install multiple specific patches on a group of computers, repeat these steps as many times as patches you want to install.

Tasks (2)

Follow these steps to install one, multiple or all types of patches on a computer group:

- Go to top menu Computers and click the Folders tab in the computer tree (left panel). Next, click the group’s context menu.
- Click the Schedule patch installation option. This will take you to the task settings screen.
- Configure the task, indicating the type or types of patches that will be installed on the group. Click the Save button and publish it.

Available patches list (3)

Follow these steps to install a specific patch on multiple computer groups:

- Go to top menu Status, click Add in the My list section of the side panel and select the
Available patches list.
- Use the filter tool to find the patch to install.
- Click the checkbox besides the patch to install and click **Schedule installation** to create a task.
- Go to top menu **Tasks** and edit the task you have just created.
- In the **Recipients** field, add the groups that the patch will be applied to (use the **Computer groups** section to do this). Remove any additional computer that may appear in the **Additional computers** section.
- Click **Back**, finish configuring the task and click **Save**.
- Publish the task.

To install multiple specific patches on multiple computer groups, repeat these steps as many times as patches you want to install.

**Tasks (3)**

Follow these steps to install one, multiple or all types of patches on multiple or all computer groups:
- Go to top menu **Tasks**, click **Add task** and select **Install patches**.
- Set the **Recipients** field, indicating the computers and groups that the patches will be applied to.
- Select the types of patches to install.
- Click **Save** and publish the task.

**12.2.4 Uninstall problematic patches**

Sometimes, the patches published by software vendors do not work correctly, which can lead to serious problems. This can be avoided by selecting a small number of test computers prior to deploying a patch across the entire network. In addition to this, **Panda Endpoint Protection / Plus** also lets you remove (roll back) installed patches.

**Requirements to uninstall an installed patch**
- The administrator must have the Install/Uninstall patches permission enabled. Refer to chapter 20 Controlling and monitoring the management console for more information.
- The patch must have been successfully installed.
- The patch must support the rollback feature. Not all patches support this feature.

**Uninstalling a patch:**
- Go to the patch uninstallation screen. There are three ways to do this:
  - Go to the **Status** menu at the top of the console, click **Add** in the **My lists** section of the side panel and select the **Installation history** list.
  - Access the list of installed patches via the **Tasks** menu at the top of the console. Select the task that installed the patch you want to uninstall and click the **View installed patches** link in the top-right corner of the screen.
  - Go to the **Status** menu at the top of the console. Click the **Patch Management** dashboard from the menu on the left and access the **Last patch installation tasks**
widget. Then, click the View installation history link.

- From the list displayed, select the patch you want to uninstall.
- If the patch can be removed, the Uninstall the patch button will be displayed. Click the button to access the computer selection screen.
  
  Select **Uninstall from all computers** to remove the patch from all computers on the network.
  
  Select **Uninstall from {{hostName}} only** to remove the patch from the selected computer only.

- **Panda Endpoint Protection / Plus** will create an immediate execution task to uninstall the patch.
- If a restart is required to finish uninstalling the patch, the solution will wait for the user to restart it manually.

Uninstalled patches will be shown again in the lists of available patches, and will be installed again the next time a scheduled patch installation task is run. If a patch is withdrawn by the corresponding vendor, it will no longer be shown or installed.

12.2.5 **Make sure the programs installed on your computers are not in EOL (End-Of-Life) stage**

Programs in EOL (End-Of-Life) stage do not receive any type of update from the relevant software vendor, therefore it is advisable to replace them with an equivalent program or a more advanced version.

Follow these steps to find those programs on the network that have reached their EOL or will reach it shortly:

- Go to the Status menu at the top of the console and click Patch management from the side panel.
- You’ll see the End-of-Life programs widget, which is divided into the following sections:
  
  **Currently in EOL**: programs on the network that do not receive updates from the relevant vendor.
  
  **In EOL (currently or in 1 year)**: programs on the network that have reached their EOL, or will reach their EOL in a year.

  **With known EOL date**: programs on the network with a known EOL date.

Follow these steps to find all programs on your network with a known EOL date:

- Go to top menu Status and click Add in the My lists section in the side panel.
- Select the End-of-Life programs list.

The list displays a line for each computer-EOL program pair found.
12.2.6 Check the history of patch and update installations

Follow these steps to find out if a specific patch is installed on your network computers:

- Go to top menu Status and click Add in the My lists section in the side panel.
- Select the Installation history list.

The list displays a line for each computer-installed patch pair found, with information about the affected program's or operating system's name and version, and the patch criticality/type.

12.2.7 Check the patch status of those computers where incidents have been recorded

Panda Endpoint Protection / Pro correlates those computers where incidents have been recorded with their patch status so that it is possible to determine whether an infected computer or a computer where threats have been detected has missing patches.

Follow these steps to check whether a computer where an incident has been detected has missing patches:

- Go to top menu Status, click on the Malware activity, PUP activity, Currently blocked programs being classified, or Threats detected by the antivirus widgets and click a computer-threat. Information about the threat detected on the computer will be displayed.
- In the Affected computer section, click the View available patches button. The Available patches list will be displayed, filtered by the relevant computer.
- Select all of the available patches for the computer and click Install from the action bar in order to create a quick patch installation task.

12.3. Configuring the discovery of missing patches

Panda Patch Management keeps an inventory of missing patches and updates for all computers on your network that have an active Panda Patch Management license.

Follow these steps to configure the discovery of missing patches:

- Go to top menu Settings and click Patch management from the side panel.
- Click the Add button and configure the options described in the following sections.
- Assign the new settings to those computers on your network with an active Panda Patch Management license.
12.3.1 General options

Click the **Automatically search for patches** switch to enable the patch search functionality. If the switch is not on the **ON** position, the lists in the module won't display missing patches, although it will still be possible to apply them via the patch installation tasks.

12.3.2 Search frequency

**Search for patches with the following frequency** indicates how frequently **Panda Patch Management** checks for missing patches on your computers using its cloud-hosted patch database.

12.3.3 Patch criticality

Sets the criticality of the patches that **Panda Patch Management** will look for in its cloud-hosted database.

The criticality level of patches is defined by the vendor of the software affected by the vulnerability. The classification criteria are not universal. We recommend that, prior to installing a patch, you check its description, especially for those patches not classified as ‘critical’. This way, you can choose to install the patch or not depending on whether you are suffering the symptoms described.

12.4. Available panels/widgets

Next is a description of the widgets implemented in the **Patch Management** dashboard, their areas and hotspots, as well as the tooltips and what they mean.

12.4.1 Patch management status

Shows those computers where **Panda Patch Management** is working properly and those where there have been errors or problems installing or running the module. The status of the module is represented with a circle with different colors and associated counters. The panel offers a graphical representation and percentage of those computers with the same status.

- **Enabled**: shows the percentage of computers where **Panda Patch Management** was installed successfully, is running properly and the assigned settings enables the module to search for patches automatically.
- **Disabled**: shows the percentage of computers where **Panda Patch Management** was installed successfully, is running properly but the assigned settings prevent the module from searching for patches automatically.
- **No license**: computers where **Panda Patch Management** is not working because there are insufficient licenses or because an available license has not been assigned to the computer.
- **Installation error**: indicates the computers where the module could not be installed.
- **No information**: computers that have just received a license and haven’t reported their status to the server yet, and computers with an outdated agent.

- **Error**: computers where the **Panda Patch Management** module does not respond to the requests sent from the server, or its settings are different from those defined in the Web console.

- **Central area**: shows the total number of computers compatible with the **Panda Patch Management** module.

  **PATCH MANAGEMENT STATUS**

  ![](/path/to/figure62.png)

  > 60 computers have been discovered that are not being managed by Panda All features.

  **Figure 62: ‘Patch management status’ panel**

- **Lists accessible from the panel**

  **PATCH MANAGEMENT STATUS**

  ![](/path/to/figure63.png)

  > 60 computers have been discovered that are not being managed by Panda All features.

  **Figure 63: hotspots in the ‘Patch management status’ panel**

The lists accessible from the panel will display different information based on the hotspot clicked:

- (1) **Patch management status** list filtered by **Patch management status** = Disabled
- (2) **Patch management status** list filtered by **Patch management status** = Enabled
- (3) **Patch management status** list filtered by **Patch management status** = Installation error
- (4) **Patch management status** list filtered by **Patch management status** = No license
12.4.2 Time since last check

Displays computers that have not connected to the Panda Security cloud to report their patch status for a certain amount of time. Such computers are susceptible to security problems and require special attention from the administrator.

- **Meaning of the data displayed**
  - **72 hours**: number of computers that have not reported their patch status in the last 72 hours.
  - **7 days**: number of computers that have not reported their patch status in the last 7 days.
  - **30 days**: number of computers that have not reported their patch status in the last 30 days.

- **Lists accessible from the panel**

The lists accessible from the panel will display different information based on the hotspot clicked:

- (1) **Patch management status** list filtered by **Last checked** = More than 3 days ago and **Patch management status** = Enabled and Disabled.

- (2) **Patch management status** list filtered by **Last checked** = More than 7 days ago and **Patch management status** = Enabled and Disabled.

- (3) **Patch management status** list filtered by **Last checked** = More than 30 days ago and **Patch management status** = Enabled and Disabled.
12.4.3 End-of-Life programs

Shows information about the End-of-Life of the programs on the network, grouped by date.

- **Meaning of the data displayed**
  - **Currently in EOL** programs on the network that have reached their EOL.
  - **In EOL (currently or in 1 year)** programs on the network that have reached their EOL or will reach it in a year.
  - **With known EOL date** programs on the network with a known EOL date.

- **Lists accessible from the panel**

The lists accessible from the panel will display different information based on the hotspot clicked:

- (1) **End-of-Life programs** list filtered by **End-of-Life date** = Currently in EOL
- (2) **End-of-Life programs** list filtered by **End-of-Life date** = In EOL (currently or in 1 year).
- (3) **End-of-Life programs** list filtered by **End-of-Life date** = All.
12.4.4 Last patch installation tasks

LAST PATCH INSTALLATION TASKS

- Nueva tarea de instalación de parches
- Instalar el parche de Firefox 52 en 9 equipos (17/07/2018 8:24:58)
- Instalar el parche de Firefox 60 x64 en WIN_DESKTOP_11 (17/07/2018 8:24:58)
- Install Internet Explorer 11 patch on 6 computers
- New task (Install patches): Install patches with the following criticality

Figure 68: 'Last patch installation tasks' panel

Shows a list of the last patch installation tasks created. This widget displays multiple links through which you can manage the patch installation tasks:

- Click a task to edit its settings.
- Click the View all link to access the top menu Tasks. There you'll see all the tasks that have been created.
- Click the View installation history link to access the Installation history list. There you'll see the patch installation tasks that have finished successfully or with errors.

12.4.5 Patch criticality

</tr>
</tbody>
</table>

View all available patches (477)

Figure 69: 'Path criticality' panel

Shows the number of computer-missing patch pairs on the network, sorted by patch type. Each missing patch is counted as many times as there are computers that don't have it installed.

- **Meaning of the data displayed**
  - **Critical patches (non-security-related)** - **Critical**: number of non-security patches rated 'critical' and pending application.
  - **Security patches** - **Critical**: number of security patches rated 'critical' and pending application.
- **Security patches - Important**: number of security patches rated ‘important’ and pending application.

- **Security patches - Low**: number of security patches rated ‘low’ and pending application.

- **Security patches - Unspecified**: number of security patches that don’t have a severity rating and are pending application.

- **Other patches**: number of non-security patches that are pending application.

- **Service Packs - Service Packs**: number of patch and hotfix bundles that are pending application.

- **View all available patches**: number of patches of any severity, related or not to system security and which are pending application.

- **Lists accessible from the panel**

</table>

*View all available patches (478)*

Figure 70: hotspots in the ‘Path criticality’ panel

The lists accessible from the panel will display different information based on the hotspot clicked:

- (1) **Available patches** list filtered by **Criticality** = Critical (security-related).

- (2) **Available patches** list filtered by **Criticality** = Important (security-related).

- (3) **Available patches** list filtered by **Criticality** = Low (security-related).

- (4) **Available patches** list filtered by **Criticality** = Unspecified security-related).

- (5) **Available patches** list filtered by **Criticality** = Other patches (non-security-related).

- (6) **Available patches** list filtered by **Criticality** = Service Pack.

- (7) **Available patches** list without any filters.

### 12.5. Available lists

#### 12.5.1 'Patch management status' list

This list shows all computers on the network that are compatible with **Panda Patch Management** (with filters to allow administrators to identify those workstations and servers that are not using the service due to one of the reasons displayed in the associated panel).
### Fields in the 'Patch management status' list

<table>
<thead>
<tr>
<th>Field</th>
<th>Comments</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Computer</td>

Table 26: filters available in the 'Installation history' list

### 12.6. Downloading and installing patches

In order to install patches and updates, **Panda Patch Management** uses the task infrastructure implemented in **Panda Endpoint Protection / Pro**.

> It is not possible to install the patches released by Microsoft if the Windows Update service is disabled on the target workstation or server.

#### 12.6.1 Patch installation

To speed up the configuration process when patching computers, **Panda Endpoint Protection / Pro** lets you create patching tasks by leveraging preconfigured parameters. The number of preconfigured parameters will differ (all, some or none) depending on where in the management console you create the task from:
- From the **Tasks** menu at the top of the console.
- From the **Available patches** list.
- From the folder tree.
- From the **Computers** screen.

The preconfigured parameters can be as follows:

- **Recipients**: the computers that will receive the patch or patch group. These can be groups as well as individual workstations or servers.
- **Patches**: the specific updates to be installed.
- **Task type**: quick or scheduled.

**Top menu Tasks**

Lets you create tasks from scratch. Neither the patches to be installed nor the target computers are preconfigured.

Follow the steps below to create a patch installation task:

- Go to top menu **Tasks**, click **Add task** and select **Install patches**.
- In the **Recipients** field, select the groups and computers that will receive the task.
- Schedule the task. See chapter 14 Tasks for more information.
- Select the type of patches to install. When creating a new task from scratch you cannot specify individual patches.
- Set the restart options in case the target workstation or server needs to be restarted to finish installing the patch.
  - **Do not restart automatically**: upon completing the patch installation task, a window is displayed to the target computer user with the options **Restart now** and **Remind me later**. If the latter is selected, a reminder will be displayed 24 hours later.
  - **Automatically restart workstations only**: upon completing the patch installation task, a window is displayed to the target computer user with the **Restart now** option, a **Minimize** button and a 4-hour countdown timer. This window will be maximized every 30 minutes as a reminder to the user. Less than one hour before the restart, the minimize button will be disabled. When the countdown finishes, the computer will be restarted.
  - **Automatically restart servers only**: this option behaves in the same way as **Automatically restart workstations only**.
  - **Automatically restart both workstations and servers**: this option behaves in the same way as **Automatically restart workstations only**.
- Click **Save** and publish the task.

**'Available patches' list**

Lets you create tasks using preconfigured computer-patch pairs.

Follow these steps to create a patch installation task from the **Available patches** list:

- Go to top menu **Status**, click **Add** in the **My list** section of the side panel and select the
Available patches list.
- Select the computer-patch pairs that suit your needs.
- If you select multiple patches, click **Install** (quick task) or **Schedule installation** (scheduled task) from the action bar in order to install them.
  - Quick tasks are automatically published.
  - Scheduled tasks are not published immediately and may require configuration changes. Go to the **Tasks** menu at the top of the console to edit and publish a scheduled task.
- If you select a single computer-patch pair, you can use the computer's context menu to select **Install** or **Schedule installation**.

**Folder tree**
Lets you create tasks using preconfigured computer groups. These tasks are always scheduled tasks.

Follow these steps to create a scheduled patch installation task from the folder tree:

- Go to top menu **Computers**, and click the context menu of the computer group that will receive the scheduled patch installation task.
- Select **Schedule patch installation**.
- Go to top menu **Tasks**, and edit the task to configure the type of patches to install.
- Click **Save** and publish the task.

**The Computers screen**
Lets you create tasks for specific computers. These tasks are always scheduled tasks.

Follow these steps to create a scheduled patch installation task from the **Computers** screen:

- Go to top menu **Computers**, and click the group that contains the computers that will receive the scheduled patch installation task.
- From the right panel, click the checkboxes besides the computers that will receive the patch installation task.
- Select **Schedule patch installation** from the action bar. If the patches are to be applied to a single workstation or server, you can use the computer's context menu.
- Go to top menu **Tasks**, and edit the task to configure the type of patches to install.
- Click **Save** and publish the task.

**12.6.2 Patch download and bandwidth savings**
Prior to installing a patch, it must be downloaded from the Panda Security cloud. This download takes place in the background and separately on each computer as soon as the installation task is launched. To minimize bandwidth usage, the module leverages the cache/repository node infrastructure implemented on the customer's network.

*Proxy nodes cannot download patches or updates. Likewise, no patches or updates are downloaded if the node or computer with the cache/repository role does not have direct access to the Panda Security cloud.*
Nodes with the cache/repository role store patches for a maximum of 30 days; after then the patches are deleted. If a computer requests a patch from a cache node, but the node doesn't have the patch in its repository, the computer will wait for the cache node to download it. The wait time will depend on the size of the patch to download. If the node cannot download the patch, the computer will attempt to download it directly instead.

Once a patch has been applied to a target computer, it will be deleted from the computer's storage media.

### 12.6.3 Installation task sequence

Patch installation tasks may require downloading patches from the Panda Security cloud if the nodes on the network with the cache/repository role don't already have the relevant patches. In this scenario, bear in mind that quick tasks start downloading the necessary patches as soon as they are created. This may result in high bandwidth usage if these tasks affect many computers or there is a huge amount of data downloaded.

In contrast, scheduled patch installation tasks start downloading the necessary patches when configured in the settings. However, if the start time of multiple tasks coincides, the module will introduce a short random delay of up to 2 minutes to prevent downloads from overlapping and minimize bandwidth usage to a certain extent.
13. Software updates

Protection engine updates
Communication agent updates
Knowledge updates
Update cache
13.1. Introduction

**Panda Endpoint Protection / Plus** is a cloud-based managed service that doesn't require customers to update the back-end infrastructure that supports the protection service. However, it is necessary to update the software installed on the customer’s computers.

The components installed on users’ computers are the following:

- [ ] Panda communications agent
- [ ] **Panda Endpoint Protection / Plus** protection engine
- [ ] Signature file for the traditional antivirus protection

The update procedure and options will vary depending on the operating system of the computer to update, as indicated in Table 27:

<table>
<thead>
<tr>
<th>Module</th>
<th>Platform</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Windows</td>
</tr>
<tr>
<td><strong>Panda agent</strong></td>
<td>On-demand</td>
</tr>
<tr>
<td><strong>Panda Endpoint Protection / Plus protection</strong></td>
<td>Configurable</td>
</tr>
<tr>
<td><strong>Signature file</strong></td>
<td>Enable/Disable</td>
</tr>
</tbody>
</table>

Table 27: update procedures based on platform and module

- **On-demand updates:** the administrator can launch the update whenever they want, provided there is an update available. They can also postpone them as long as they want.
- **Configurable updates:** the administrator can establish update intervals for future and recurrent updates, and disable them as well.
- **Enable/Disable:** the administrator can disable the update. If an update is enabled, it will take place automatically whenever it is available.
- **No:** the administrator cannot influence the update process. Updates will take place as soon as they are available, and it’s not possible to disable them.

13.2. Configuring protection engine updates

To configure the **Panda Endpoint Protection / Plus** protection engine updates, you must create and assign a ‘Per-computer settings’ configuration profile. To do this, go to the **Settings** menu, and select **Per-computer settings** from the left-hand menu.
13.2.1 Updates

To enable the automatic updates of the Panda Endpoint Protection / Plus protection module, select the **Automatically update Aether on devices** checkbox. This will enable all other settings options on the screen. If that option is cleared, the protection module will never be updated.

---

**Running updates at specific time intervals**

Configure the following parameters for computers to run updates at specific time intervals:

- **Start time**
- **End time**

To run updates at any time, select **Anytime**.

**Running updates on specific days**

Use the drop-down menu to specify the day the update should be run:

- **Any day**: the updates will run when they are available.
- **Days of the week**: use the checkboxes to select the days of the week when the Panda Endpoint Protection / Plus updates will run. If an update is available, it will run on the first day of the week that coincides with the administrator's selection.
- **Days of the month**: use the menus to set the days of the month when the Panda Endpoint Protection / Plus updates will run. If an update is available, it will run on the first day of the month that coincides with the administrator's selection.
- **On the following days**: use the menus to set a specific date range for the Panda Endpoint Protection / Plus updates. This option lets you select update intervals that won't be repeated over time. After the specific date, no updates will be run. This option forces the administrator to constantly establish a new update interval as soon as the previous one has expired.

**Computer restart**

Panda Endpoint Protection / Plus lets you define a logic for computer restarts, if needed, by means of the drop-down menu at the bottom of the settings window:

- **Do not restart automatically**: the end user will be presented with a restart window with increasingly shorter time intervals. They will be prompted to restart their computer to apply the update.
- **Automatically restart workstations only**
- **Automatically restart servers only**
- **Automatically restart both workstations and servers**
13.3. Configuring communications agent updates

The Panda agent is updated on demand. **Panda Endpoint Protection / Plus** will display a notification in the management console indicating the availability of a new agent version. From then on, the administrator will be able to launch the update whenever they want to.

Updating the Panda agent does not require restarting users' computers. These updates usually contain changes and improvements to the management console to ease security administration.

13.4. Configuring knowledge updates

To configure **Panda Endpoint Protection / Plus**'s signature file updates, go to the security configuration profile assigned to the computer, depending on its type.

### 13.4.1 Windows, Linux and macOS devices

Go to **Settings**, and select **Workstations and servers** from the left-hand menu.

Go to **General**. There you will see the following options:

- **Automatic knowledge updates**: allows you to enable or disable signature file downloads. If you clear this option, the signature file will never get updated.

  It is not advisable to disable the automatic knowledge updates. A computer with out-of-date protection will be more vulnerable to threats.

- **Run a background scan every time there is a knowledge update**: lets you automatically run a scan every time a signature file is downloaded onto the computer. These scans will have minimum priority so as not to interfere with the user's work.

### 13.4.2 Android devices

Go to **Settings**, and select **Android devices** from the left-hand menu.

**Panda Endpoint Protection / Plus** lets you restrict software updates so that they don't consume mobile data.

Select this option to restrict updates to those occasions when there is an available Wi-Fi connection for your smartphone or tablet.
14. Tasks

Task creation
Creating a task
Task management
Updating recipients
14.1. Introduction

A task is a resource implemented in *Panda Endpoint Protection / Pro* that allows administrators to associate a process with two variables: repetition interval and execution time.

- **Repetition interval**: tasks can be configured to be performed only once, or repeatedly through specified time intervals.
- **Execution time**: tasks can be configured to be run immediately after being set (immediate task), or at a later stage (scheduled task).

14.1.1 General process of launching a task

The process of launching a task is divided into three steps:

- **Task creation and configuration**: select the computers, the characteristics of the task, the time/date, the frequency, and the way it will behave in the event of an error.
- **Task publication**: once you create a task, you must activate it by entering it in the *Panda Endpoint Protection / Plus* task scheduler. Activated tasks will be run on the scheduled day/time.
- **Task execution**: the task will be run when the configured conditions are met.

14.2. Task creation

Depending on your need to configure all parameters of a task, these can be set up from different areas of the management console:

- Tasks area
- Computer tree
- Computers area
- Lists

The primary resource to create a task is the *Tasks* menu at the top of the console. This area lets you create a task from scratch, defining all related aspects (recipients, execution time, repetition interval, publication, etc.).

The *Computers* area, the computer tree and the lists let you schedule and launch task easily and quickly, without having to go through the entire process of configuring and publishing the task. However, they provide less configuration flexibility.
14.3. Creating a task from the Tasks area

To create a task, click the **Tasks** menu at the top of the console. A window will appear where you will see all created tasks, and their status. To create a new task, click **Add** and select a task type from the drop-down menu. A window will be displayed with the task details, divided into three areas:

- **Overview**: task name and description.
- **Recipients**: computers that will receive the task.
- **Schedule**: task schedule (day and time).

14.3.1 Task recipients

- Click **Recipients**. A window will open for you to select the computers that will receive the configured task.
- Click + to add a new computer, and - to remove computers.

To access the computer selection window you must first save the task.

14.3.2 Task schedule and frequency

You can configure the following schedule options:

- **Starts**: indicates the task start time/date.
- **Maximum run time**: indicates the maximum time that the task can take to complete. After that time the task will be canceled if it is not completed.
- **Repeat**: indicates the frequency of the task from the time/date indicated in the **Starts** field.

**Starts**:

- **As soon as possible (enabled)**: the task will be launched immediately provided the computer is available (turned on and accessible from the cloud), or as soon as it becomes available within the time interval specified if the computer is **tuned off**.
- **As soon as possible (disabled)**: the task will run on the date selected in the calendar. Specify whether to take into account the computer’s local time or the **Panda Endpoint Protection / Plus server time**.
- **If the computer is tuned off**: if the computer is tuned off or cannot be accessed, the task won’t run. The task scheduler lets you establish the task’s expiration date, from 0 (the task expires immediately if the computer is not available) to infinite (the task is always active and waits indefinitely for the computer to be available).
  - **Do not run**: the task is immediately canceled if the computer is not available at the scheduled time.
  - **Run the task as soon as possible, within**: lets you define the time interval during which the task will be run if the computer becomes available.
- **Run when the computer is turned on**: there is no time limit. The system waits for the computer to be available to launch the task.

**Maximum run time**
- **No limit**: there is no time limit for the task to complete.
- **1, 2, 8 or 24 hours**: there is a time limit for the task to complete. After that time interval, the task will be canceled returning an error.
- **Repeat**: indicates a repeat interval (every day, month or day) from the date specified in the **Starts** field.

### 14.3.3 Task publication

Once you have created and configured a task, it will be added to the list of configured tasks. However, the task will not be active until it is published. To publish a task, click the **Publish now** button.

As soon as you publish a task, it will be added to the **Panda Endpoint Protection / Plus** task scheduler, which will launch the task based on its settings.

### 14.4 Task management

Click the **Tasks** menu at the top of the console to list, delete, copy, cancel or view the results of created tasks.

#### 14.4.1 List of created tasks

This list shows details of all created tasks, their type, status and other relevant information.

<td>Character string</td>
</tr>
</tbody>
</table>
14.4.2 Modifying a published task

Click a task's name to display its settings window. There you will be able to edit any of the task's settings.

You can only change the name and description of a published task. To modify a published task, you must copy it.

Canceling a published task

To cancel a published task, click the Cancel link. The task will be canceled, but it won't be deleted from the task window so you will still be able to view its results.

Deleting a task

Executed tasks are not deleted automatically. To delete them, you must click the icon.

Deleting a task also deletes its results.

Copying tasks

Click a task's icon to copy it. The new task will have the same settings as the original one.

Viewing a task's results

You can view the current results of any published task by clicking the View results link. A window with the results will appear, along with some filters for you to search for specific information.

Table 30 shows the fields in the task table:
### Table 30: filtering parameters for task results

Tabla 31: task search filters

### Editing tasks

To edit an already created or published task, click its name. This will open the task edit window, which displays the same fields as the task creation window.

To view the list of computers that will receive the task, click the **View computers** button. This will take you to the **Computers** section, with a computer list filtered by the selected task.
14.5. Updating the recipients of scheduled tasks

The set of computers that will receive a task may be difficult to determine due to the following reasons:

- Groups are dynamic entities that may change over time.
- Tasks are actions taken on groups and defined at a certain moment in time, although they can be run (repeatedly or not) at a later time.

That is, you can define a task at a specific time (T1) to be run on one or several groups containing a series of computers. However, at the time when the task is run (T2), the computers in those groups may have changed.

When it comes to determining which computers will receive a configured task, there are three cases depending on the task:

- Immediate tasks
- Scheduled one-time tasks
- Scheduled recurring tasks

14.5.1 Immediate tasks

These tasks are created, published and launched almost simultaneously and only once. The target group is evaluated at the time the administrator creates the task. The status of the task for the affected computers will be Pending.

Adding computers to the task

It is not possible to add new computers to the task. Even if you add new computers to the target group, they won't receive the task.

Removing computers from the task

However, you can remove computers from an existing task. If you move a computer from the group set to receive the task to another group, the affected computer won't run the task.

14.5.2 Scheduled one-time tasks

These are two possible scenarios with these tasks:

Tasks which started running less than 24 hours ago

During the first 24 hours after a task starts running, you can add or remove computers from the task or the target groups.

This 24-hour period is established to cover all time zones for multinational companies with a presence in several countries.
Tasks which started running more than 24 hours ago

24 hours after a task starts running, it is not possible to add new computers to the task. Even if you add new computers to the target group, they won't receive the task. However, it will be possible to withdraw computers from the task. Taking a computer out of the target group will cancel the task on that computer.

14.5.3 Scheduled recurring tasks

These tasks admit the addition and removal of target computers at any time before they are canceled or completed.

The status of the task for each computer will be gradually shown as Aether Platform receives the relevant information.
15. Malware and network visibility

Overview of the Status menu
Panels and widgets
Introduction to the lists
Available lists
Default lists
15.1. Introduction

**Panda Endpoint Protection / Plus** offers administrators three large groups of tools for viewing the security status and the networks they manage:

- The dashboard, with real-time, up-to-date information.
- Custom lists showing incidents, detected malware and managed devices along with their status.
- Networks status reports with information collected and consolidated over time.

For information about the consolidated reports, see Chapter 19 Reports.

Visualization and monitoring tools determine in real time the network security status as well as the impact of any possible security breaches in order to facilitate the implementation of appropriate security measures.

15.2. Overview of the Status menu

The **Status** menu includes the main visualization tools and has several sections, which you can see below:

![Status window with the dashboard and access to the lists](image)

**Accessing the dashboard (1)**

You can access the dashboard through the **Status** menu at the top of the screen. From the dashboard you can access different widgets, as well as the lists.
The widgets represent specific aspects of the managed network, while more detailed information is available through the lists.

**Time period selector (2)**

The dashboard displays information about the time period established by the administrator via the tool at the top of the **Status** screen. The options are:

- Last 24 h
- Last 7 days
- Last month
- Last year

Information panels/widgets (5)

The dashboard has a series of widgets related to a specific aspect of network security.

The information in the panels is generated in real time and is interactive: hover the mouse pointer over each item to display tooltips with more detailed information.

All the graphs have a key explaining the meaning of the data, and have hotspots that can be selected to display lists with predefined filters.

---

**Dashboard selector (3)**

- **Security**: security status of the IT network.
- **Web access and spam**: blocking and filtering of Internet contents and unsolicited email on Microsoft Exchange servers.
- **Licenses**: refer to chapter 5 for more information about license management.
- **Executive report**: refer to chapter 19 for more information about how to configure and generate reports.

This chapter deals with the resources provided in sections **Security** and **Web and spam access**.

**My lists (4)**

The lists are data tables with the information presented in the panels. This includes highly detailed information and has search tools to locate the information you need.
Panda Endpoint Protection / Plus uses several types of graphs to display information in the most practical way based on the type of data displayed:

- Pie charts
- Histograms
- Bar charts

Click the items in the graphs to display more detailed lists.

15.3. Available panels/widgets

Below is a description of the different widgets displayed in the Panda Endpoint Protection / Plus dashboard, their areas and hotspots, as well as their tooltips and their meaning.

15.3.1 Protection status

Protection status shows those computers where Panda Endpoint Protection / Plus is working properly and those where there have been errors or problems installing or running the protection module. The status of the network computers is represented with a circle with different colors and associated counters.

The panel offers a graphical representation and percentage of those computers with the same status.

The sum of all computers can be more than 100% as the status types are not mutually exclusive.
• **Meaning of the different status types**

  - **Properly protected**: indicates the percentage of computers where **Panda Endpoint Protection / Plus** installed without errors and is working properly.
  
  - **Installing**: this indicates the percentage of computers on which **Panda Endpoint Protection / Plus** is currently being installed.
  
  - **No license**: computers without a license are those that are not protected because there are insufficient licenses or because an available license has not been assigned to the computer.
  
  - **Disabled protection**: these are computers that don’t have the antivirus protection enabled.
  
  - **Protection with errors**: this includes computers with **Panda Endpoint Protection / Plus** installed, but for one reason or another the protection module is not responding to the requests from the Panda Security server.
  
  - **Install error**: this indicates the computers on which the installation of the protection has not been properly completed.
  
  - **Center**: the center of the pie chart indicates the total percentage of unprotected computers out of all of those visible to **Panda Endpoint Protection / Plus**. For a computer to be visible it must have the Panda agent installed.
Lists accessible from the panel

The lists accessible from the panel will display different information based on the hotspot clicked:

- (1) Computer protection status list filtered by Protection status = Properly protected
- (2) Computer protection status list filtered by Protection status = Protection with errors
- (3) Computer protection status list filtered by Protection status = Installing
- (4) Computer protection status list filtered by Protection status = Disabled protection
- (5) Computer protection status list filtered by Protection status = No license
- (6) Computer protection status list filtered by Protection status = Install error
- (7) Computer protection status list without any filters

15.3.2 Offline computers

Offline computers displays the computers that have not connected to the Panda Security cloud for a certain amount of time. Such computers are susceptible to security problems and require special attention from the administrator.
• **Meaning of the pie charts displayed**
  - **72 hours**: number of computers that have not reported their status in the last 72 hours.
  - **7 days**: number of computers that have not reported their status in the last 7 days.
  - **30 days**: number of computers that have not reported their status in the last 30 days.

• **Lists accessible from the panel**

  OFFLINE COMPUTERS

  ![Pie chart]

  Figure 76: hotspots in the Offline computers panel

  The lists accessible from the panel will display different information based on the hotspot clicked:

  - (1) **Offline computers** list filtered by **Last connection** = More than 72 hours ago
  - (2) **Offline computers** list filtered by **Last connection** = More than 7 days ago
  - (3) **Offline computers** list filtered by **Last connection** = More than 30 days ago

**15.3.3 Outdated protection**

  OUTDATED PROTECTION

  ![Bar chart]

  Figure 77: outdated protection panel

  **Outdated protection** displays the computers on which the latest version of the signature file is more than three days older than the latest one released by Panda Security. It also displays the computers on which the latest version of the antivirus engine is more than seven days older than the latest one released by Panda Security. Such computers are therefore vulnerable to attacks from threats.

• **Meaning of the bars**

  The panel shows the percentage and number of computers that are vulnerable because their protection is out of date, under three concepts:

  - **Protection**: for at least seven days the computer has had a version of the antivirus engine older than the latest one released by Panda Security.
- **Knowledge**: it has been at least three days since the computer has updated the signature file.
- **Pending restart**: the computer requires a restart to complete the update.

- **Lists accessible from the panel**

  ![]()

  **OUTDATED PROTECTION**

<table>
<thead>
<tr>
<th>Protection</th>
<th>Knowledge</th>
<th>Pending restart</th>
</tr>
</thead>
<tbody>

<td>2</td>
</tr>
<tr>
<td>5</td>
<td>2</td>
<td>3</td>
</tr>
</tbody>
</table>

  ![hotspots in the Outdated protection panel](image)

  The lists accessible from the panel will display different information based on the hotspot clicked:

  - (1) Computer protection status list filtered by Updated protection = No
  - (2) Computer protection status list filtered by Knowledge = No
  - (3) Computer protection status list filtered by Updated protection = Pending restart

  **15.3.4 Programs allowed by the administrator**

  ![Programs allowed by the administrator panel](image)

  **PROGRAMS ALLOWED BY THE ADMINISTRATOR**

  9  5 malware 3 PUPs 1 being classified

  If the administrator wants to allow the execution of an item already classified as a threat, **Panda Endpoint Protection / Plus** has tools to restore deleted files.

  **Meaning of the information displayed in the panel**

  The panel represents the total number of items excluded from blocking, broken down into three types:

  - Malware
  - PUP
- Being classified

- Lists accessible from the panel

**PROGRAMS ALLOWED BY THE ADMINISTRATOR**

<table>
<thead>
<tr>
<th>Malware</th>
<th>PUPs</th>
<th>Being classified</th>

<td>3</td>
<td>1</td>
</tr>
</tbody>
</table>

Figure 80: hotspots in the ‘Programs allowed by the administrator’ panel

- (1) Programs allowed by the administrator list with no filters
- (2) Programs allowed by the administrator list filtered by **Current classification** = Malware
- (3) Programs allowed by the administrator list filtered by **Current classification** = PUP
- (4) Programs allowed by the administrator list filtered by **Current classification** = Being classified (blocked and suspicious items)

### 15.3.5 Threats detected by the antivirus

**Threats detected by the antivirus** consolidates all the intrusion attempts that **Panda Endpoint Protection / Plus** has dealt with in the selected time period.

The data covers all infection vectors and all supported platforms, so administrators are able to get specific data (volume, type, form of attack) related to the malware that reached the network during a selected period of time.

**Threats detected by the antivirus**

- Phishing
- Intrusion attempts blocked
- Devices blocked
- Dangerous actions blocked
- Tracking cookies
- Malware URLs blocked

Figure 81: ‘Threats detected by the antivirus’ panel

- **Meaning of the information displayed in the panel**

This panel comprises two sections: a line chart and a summarized list.

The line chart represents detections on the network overtime, split into malware categories:
- Viruses and spyware
- Hacking tools and PUPs
- Suspicious items
- Phishing
- Other

The Y axis shows events and the X axis dates.

The list on the right shows the events that the administrator may want to review in order to look for symptoms or potentially dangerous situations.

- **Intrusion attempts blocked**: these are attacks that are blocked by the firewall and the intrusion prevention system.
- **Devices blocked**: peripheral devices blocked by the device control feature.
- **Dangerous operations blocked**: detections made by scanning local behavior.
- **Tracking cookies**: detection of cookies used to track users’ Web activity.
- **Malware URLs blocked**: web addresses that lead to pages containing malware.

- **Lists accessible from the panel**

The lists accessible from the panel will display different information based on the hotspot clicked:

- **(1) Threats detected by the antivirus list filtered by Threat type** = (Phishing OR Intrusion attempts blocked OR Devices blocked OR Dangerous operations blocked OR Tracking cookies OR Malware URLs).
- **(2) Threats detected by the antivirus list with no filters.**

**Figure 82: hotspots in the ‘Threats detected by the antivirus’ panel**
15.3.6 Content filtering for Exchange servers

Feature only available in Panda Endpoint Protection Plus.

This panel shows the number of messages blocked by the Exchange Server content filter.

- **Meaning of the information displayed in the panel**

  This shows two types of data: the number of messages filtered for having a dangerous extension, and for having a double extension.

  Hover the mouse pointer over the chart to display a tooltip with the following information:

  - **Dangerous extension**: the number of messages filtered for having an attachment with a dangerous extension.
  - **Double extension**: the number of messages filtered for having an attachment with a double extension.

15.3.7 Web access

Feature only available in Panda Endpoint Protection Plus.
This panel displays a pie chart with the different Web page categories requested by network users:

- **Meaning of the information displayed in the panel**

  The pie chart shows the 10 most important Web page categories that *Panda Endpoint Protection / Plus* identifies when categorizing the pages visited by network users:

  - Hate and intolerance
  - Criminal activity
  - Job search
  - Dating and personals
  - Finance
  - Confidential
  - Entertainment
  - Government
  - Illegal drugs
  - Other

  The pie chart key shows the percentage of Web page requests for each category.

- (2) **Web access by computer list** filtered by **Category** = Selected category

### 15.4. Introduction to the lists

**Panda Endpoint Protection / Plus** structures the information collected at two levels: a first level that presents the data graphically in panels or widgets, and a second, more detailed level, where the data is presented in tables. Most of the tables have an associated list so that the administrator can quickly access the information in a graph and then get more in depth data if required from the lists.

### 15.4.1 Templates, settings and views

The **Panda Endpoint Protection / Plus** lists are, in effect, templates, that allow one or more settings. A list can be thought of as the source of data about a specific area.

Settings are values specifically assigned to the search tools and filters associated to each template.

The settings of a template result in a list which the administrator can edit and consult later. This way, administrators can save time defining searches and filters about lists which they can use again later.

![Diagram of list template, filters, and views](image)

**Figura 94**: generating three lists from the same template/data source

#### List templates

There are 8 templates that correspond to the types of information displayed below:
- Threats detected by the antivirus
- Intrusion attempts blocked
- Devices blocked
- Access to Web pages by category (Panda Endpoint Protection Plus only)
- Access to Web pages by computer (Panda Endpoint Protection Plus only)
- Computer protection status
- Licenses
- Unmanaged computers discovered

Additionally, there are other templates you can directly access from the context menu of certain lists or from certain widgets on the dashboard. Refer to each widget's description for information about the lists they provide access to.

**Settings**

In the context of lists, the settings represent a data filter specified by the administrator and associated to a template. Each template has different filters according to the type of data displayed.

Administrators can establish as many filter settings for a template as they wish, in order to enable different views of the same source of data.

**Views of lists**

The combination of a template and settings results in a specific view of the list. A template can have several associated views if the administrator has created various settings for the same template.

![Figure 95: 'My lists' side panel](image-url)
15.4.2 My lists panel

All created lists are displayed on the left-hand side panel My lists, on the Status main screen.

15.4.3 Creating custom lists

There are four ways to create a new custom list/view:

- **From the My lists side menu**

  Click **Add** in the panel on the left to display a window with a drop-down menu with the eight available templates.

- **From a dashboard panel**

  - Click a widget on the dashboard to open its associated template.
  - Click its context menu (6) and select **Copy**. A new list will be created.
  - Edit the list filters, name and description and click **Save** (5).

- **From an existing list**

  - You can copy an existing list by clicking its context menu (6) and clicking **Copy**.
• **From the context menu of the My lists panel**

![Image of context menu](image)

**Figura 97: context menu of the lists available in the ‘My lists’ panel**

- Click the context menu of the list you want to copy.
- Click Make a copy.
- A new view will be created which you can edit according to your preferences.

### 15.4.4 Deleting a list

There are two different ways to delete a list:

- **From the My lists panel**
  - From the **My lists** panel, click the context menu of the list you want to delete.
  - Click the icon.

- **From the list itself**
  - Click the list's context menu (6)
  - Click the icon from the drop-down menu displayed.

### 15.4.5 Configuring a custom list

To define a new list, follow the steps below:

- Assign a new name to the list (1). By default, the console creates a new name for the list by adding the string “New” to the type of list, or “Copy” if the list is a copy of a previous one.
- Assign a description (2): this step is optional.
- Click the link **Filters** (3) to display the settings and search section.
- Set the data filter (4) to display the relevant details.
- Click Filter (7) to apply the configured filter in order to check if it meets your needs. The search result will be displayed in the list (8).
- Click Save (5). The list will be added to the panel on the left under My lists, and can be accessed by clicking on the name.

Also, in the menu button (6) there is an option to export the list in CSV format and to make a copy of it.

**15.4.6 Available actions on computers in lists**

The Licenses and Computer protection status lists incorporate checkboxes to allow you to select computers. Now, selecting one or more computers will immediately display an action bar at the top of the window in order to make it easier for you to manage the selected workstations and servers.

**15.5 Available lists**

**15.5.1 Computer protection status list**

This list displays all the network computers in detail, with filters that let you locate those workstations or mobile devices that are not protected due to one of the reasons displayed in the panel.

<table>
<thead>
<tr>

</table>
### Updated protection

This indicates whether the installed protection module has the latest version released.
Hover the mouse pointer over the field to see the version of the protection installed.
- Updated
- Not updated (7 days without updating since last release)
- Pending restart

### Knowledge

This indicates whether the signature file installed on the computer is the latest version.
Hover the mouse pointer over the field to see the date of the latest version installed.
- Updated
- Not updated (3 days without updating since last release)

### Last connection

Date of the last time that the Panda Endpoint Protection / Plus status was sent to the Panda Security cloud.

### 15.5.8 Licenses list

The Licenses list is covered in chapter 5 Licenses.

### 15.5.9 ‘Unmanaged computers discovered’ list

The Unmanaged computers discovered list is covered in chapter 6.
15.6. Default lists

The management console includes two lists generated by default:

- Unprotected workstations and laptops
- Unprotected servers

**Unprotected workstations and laptops**

This list lets you locate all desktop and laptop computers, regardless of the operating system installed, that may be vulnerable to threats due to a problem with the protection:

- Computers on which the **Panda Endpoint Protection / Plus** software is currently being installed or that have an installation problem.
- Computers with the protection disabled or with errors.
- Computers without a license assigned or with expired licenses.

**Unprotected servers**

This list lets you locate all servers, regardless of the operating system installed, that may be vulnerable to threats due to a problem with the protection:

- Servers on which the **Panda Endpoint Protection / Plus** software is currently being installed or that have an installation problem.
- Servers with the protection disabled or with errors.
- Servers without a license assigned or with expired licenses.
16. Managing quarantined and excluded items

Tools for managing excluded items
Excluding items
Managing excluded items
Quarantine management
16.1. Introduction

**Panda Endpoint Protection / Plus** provides a balance between the effectiveness of the security service and the impact on the daily activities of protected users. This balance is achieved through the use of several configurable tools:

- Tools for managing the execution of processes classified as threats
- Tools for managing the backup/quarantine area

**Considerations about managing processes classified as malware**

In other cases, the administrator may want to allow the execution of certain types of malware which, despite posing a potential threat, provide features valued by users. This is the case of PUPs, for example. These include toolbars that offer search capabilities but also collect users' private data and confidential corporate information for advertising purposes.

**Considerations about quarantine management**

Finally, administrators may want to have access to items classified as threats and deleted from users' computers.

16.2. Tools for managing exclusions

Administrators can manage exclusions from different areas within the management console. Below we provide a reference guide to find these tools quickly.

All of these tools are accessible from the **Status (1)** menu at the top of the console. Click the relevant widget in the dashboard.

![Dashboard tools to manage exclusions](image)
Lists of items blocked by Panda Endpoint Protection / Plus
- To get a list of currently blocked items classified as viruses: Threats detected by the antivirus panel (7).

Lists of items excluded from blocking by the administrator
- To get a list of all programs classified as a virus currently excluded from blocking: Programs allowed by the administrator panel (2).
- To get a history of currently excluded items: Programs allowed by the administrator panel (2), History context menu.
- To see the state changes of excluded items: Programs allowed by the administrator panel (2), History context menu.

Adding and removing exclusions
- To add a threat exclusion: go to the Threats detected by the antivirus panel (2), select a threat, and click Restore and do not detect again.
- To remove an exclusion: Go to the Programs allowed by the administrator panel (2), select a threat and click the icon.

16.3. Excluding items
To allow the execution of a file classified as a threat, go to the Threats detected by the antivirus panel.

16.3.1 Excluding items classified as a threat
Excluding an item classified as malware from the scans is equivalent to allowing the execution of a program that Panda Endpoint Protection / Plus has effectively classified as harmful or dangerous.

To do that, go to the Threats detected by the antivirus panel, select a threat and click the Restore and do not detect again button.

Go to the Malware/PUP activity panel, select a threat, and click the Do not detect again button to allow it to run.

Once excluded from the scans, the item in question will be added to the Threats and other excluded items list, as explained in the next section.

16.4. Managing excluded items
To manage excluded items, as well as to configure the solution's behavior when a suspicious item or a known classified item is reclassified, go to the Programs allowed by the administrator panel.
This panel lets you view and manage currently allowed files, as well as access a history of all excluded items.

**List of currently excluded items**

Programs allowed by the administrator displays items with an active exclusion. Every item on the list is allowed to run.

**History**

Click the context menu to display a history of all files excluded in Panda Endpoint Protection / Plus and the actions taken on them. This list allows you to view all the states that a file has gone through (allowed or blocked), from the time it entered the Programs allowed by the administrator list until it exited it.

### 16.5. Managing the backup/quarantine area

Panda Endpoint Protection / Plus's quarantine is a backup area that stores the items deleted after being classified as a threat.

Quarantined items are stored on each user's computer, in the Quarantine folder located in the software installation directory. This folder is encrypted and cannot be accessed by any other process. Thus, it is not possible to directly access or run any quarantined items, unless you do it using the Web console's restore tool.

**The quarantine is compatible with Windows, macOS and Linux. Android is not supported.**

Panda Endpoint Protection / Plus also quarantines suspicious files automatically, provided they meet the conditions established by Panda Security's PandaLabs department.

Once a suspicious item has been quarantined for further analysis, there are four possible scenarios:

- The item is classified as malicious but there is a disinfection routine for it: it is disinfected and restored to its original location.
- The item is classified as malicious, and there is no disinfection routine for it: it is quarantined for seven days.
- The item is identified as harmless: it is restored to its original location.
- Suspicious items are quarantined for a maximum of 30 days. If they finally turn out to be goodware, they are automatically restored to their original location.

**Panda Endpoint Protection / Plus doesn't delete files from users' computers. All removed files are actually sent to the backup area.**
16.5.1 Viewing quarantined items

Administrators can view quarantined items through the Threats detected by the antivirus widget and list.

Use the filtering tools to view quarantined items (use the Action filter: "Quarantined" or "Deleted").

16.5.2 Restoring quarantined items

To restore a quarantined item, select it and click Restore and do not detect again. This will copy the item to its original location and restore its original permissions, owner, the registry keys associated with the file and any other information.
17. Remediation tools

- Automatic computer disinfection
- On-demand file scanning and disinfection
- Computer restart
- Reporting computer problems
- External access to the console
17.1. Introduction

Panda Endpoint Protection / Plus provides several remediation tools that allow administrators to resolve the issues found in the Protection, Detection and Monitoring phases of the adaptive protection cycle.

Some of these tools are automatic and don’t require administrator intervention, whereas other require the execution of certain actions through the Web console.

The Table 53 illustrates the tools available for each platform and their type (manual or automatic).

<table>
<thead>
<tr>
<th>Remediation Tool</th>
<th>Platform</th>
<th>Type</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic computer disinfection</td>
<td>Windows, MacOS, Linux, Android</td>
<td>Automatic</td>
<td>To disinfect or quarantine malware at the time of infection</td>
</tr>
<tr>
<td>On-demand file scanning and disinfection</td>
<td>Windows, MacOS, Linux, Android</td>
<td>Automatic (scheduled)/Manual</td>
<td>To scan, disinfect and quarantine malware immediately or at scheduled times</td>
</tr>
<tr>
<td>On-demand restart</td>
<td>Windows</td>
<td>Manual</td>
<td>Forces a computer restart to apply updates, finish manual disinfection tasks and fix protection errors.</td>
</tr>
</tbody>
</table>

Table 53: Panda Endpoint Protection / Plus remediation tools

17.2. Automatic computer disinfection

Infected computers are disinfected automatically and in real time by the antivirus protection.

That is, upon detecting malware, Panda Endpoint Protection / Plus will automatically clean the affected item provided there is a disinfection method available. Otherwise, the item will be quarantined.

Automatic disinfection does not require administrator intervention. However, the File protection checkbox must be selected in the security settings assigned to the computer.

Refer to chapter 10 Security settings for workstations and servers for more information about the block modes available in Panda Endpoint Protection / Plus and the antivirus protection settings.
17.3. On-demand computer scanning and disinfection

There are two ways to scan and disinfect files on demand: one is to create a scheduled scan task and the other is to run an immediate scan.

Refer to chapter 14 Tasks for more information about how to create a scheduled scan task from the Tasks menu.

17.3.1 Creating a task from the computer tree

The computer tree lets you define scan tasks very quickly for all computers in a computer group.

- Go to the Computers menu at the top of the console and select the computer tree folder view.
- Click the context menu icon for the group whose computers you want to scan. The context menu will open.
- Click one of the following two options:
  - Scan now: lets you create a scan task which will be run immediately on all computers in the group.
  - Schedule scan: takes you to the Tasks area where you can create a recurring and/or scheduled task. The task template will be partially populated: the Recipients field will be set with the group selected in the computer tree. Fill in the remaining options, as explained in section 14.3 Creating a task from the Tasks area.

Immediate tasks

Immediate tasks (launched through the Scan now option in the context menu) have the following characteristics:

- You can select the scan type (The entire computer or Critical areas). Refer to section 14.2.2 Task scheduler and repetition for more information.
- You don't need to specify an execution time or repetition interval: They are one-time tasks which start right after being configured.
- You don't need to publish them: They are automatically published by Panda Endpoint Protection / Plus.
- The management console will display a pop-up message informing of the success or failure creating the task.
To view the result of an immediate task, click the Tasks menu at the top of the console.

**Scheduled tasks**

Scheduled tasks (launched through the Schedule scan option in the context menu) are identical to the tasks created from the Tasks menu and discussed in section 14.3 Creating a task from the Tasks area. The only difference is that the Recipients field will be populated with the group selected in the computer tree. Therefore, it will be necessary to specify the task’s execution time and repetition interval, and publish it for activation.

### 17.3.2 Creating a task from the Computers screen

The Computers screen lets you create immediate and scheduled tasks similarly to the computer tree or the Tasks area. However, in this case you can individually select computers belonging to the same group or subgroup.

Choose one of the following resources depending on the number of computers that will receive the task:

- **The computer’s context menu**: if the task is to be applied to one computer only.
- **Checkboxes and action bar**: if the task is to be applied to one or more computers belonging to a group or its subgroups.

**Context menu associated with a single computer**

- Click the **Computers** menu at the top of the console, and select the group in the computer tree that the computer to scan belongs to.
- From the computer list, click the context menu of the computer to scan. (4)
- From the context menu (5), click one of the following two options:
  - **Scan now**: lets you create a scan task which will be run immediately on the selected computer.
Schedule scan: takes you to the Tasks area where you can create a recurring and/or scheduled task. The task template will be partially populated: the Recipients field will display the selected computer. Fill in the remaining options, as explained in section 14.3 Creating a task from the Tasks area.

Checkboxes and action bar
- Click the Computers (1) menu at the top of the console, and select the group in the computer tree that the computers to scan belong to.
- Select the computers that will receive the scan task using the checkboxes (3). The action bar (2) will be immediately displayed at the top of the window.
- Click one of the following icons:
  - Scan now: lets you create a scan task which will be run immediately on the selected computers.
  - Schedule scan: takes you to the Tasks area where you can create a recurring and/or scheduled task. The task template will be partially populated: the Recipients field will display the selected computers. Fill in the remaining options, as explained in section 14.3 Creating a task from the Tasks area.

17.3.3 Scan options
The scan options let you configure the scan engine parameters in order to scan the computers' file system. The following options are available:

- Scan type
  - The entire computer: runs an in-depth scan of the computer, including every connected storage device.
  - Critical areas: quick scan of the following directories:
    - %WinDir%\system32
    - %WinDir%\SysWow64
    - Memory
    - Boot system
    - Cookies
  - Specific items: lets you enter the full path of massive storage devices. This option supports environment variables. The solution will scan the specified path and every folder and file it may contain.
- Detect viruses: detects programs that enter computers with malicious purposes. This option is always enabled.
- Detect hacking tools and PUPs: detects potentially unwanted programs, as well as programs that can be used by hackers to carry out actions that cause problems for the user of the affected computer.
- Detect suspicious files: in scheduled scans, the computer software is scanned statically, that is, running items are not scanned. Therefore it may be necessary to enable heuristic scanning algorithms to detect all types of threats.
- Scan compressed files
- Exclude the following files from scans
Do not scan files excluded from the permanent protections: the files whose execution was allowed by the administrator won't be scanned. These files will always run, along with any file globally excluded from the console.

- Extensions
- Files
- Directories

17.4. Computer restart

The Web console lets administrators restart computers remotely. This is very helpful if you have computers whose protection needs updating or if there are protection problems to fix.

- Go to the Computers menu at the top of the console and select a computer using the left-hand panel.
- To restart a single computer, click the computer's context menu on the computer list.
- To restart multiple computers, use the checkboxes to select the computers to restart, and click the global context menu.
- From the drop-down menu, select Restart.

17.5. Reporting a problem

It is possible that the Panda Endpoint Protection / Plus software may occasionally function incorrectly. Some symptoms could include:

- Errors reporting the computer status.
- Errors downloading knowledge or engine updates.
- Engine errors.

If Panda Endpoint Protection / Plus functions incorrectly on some network computers, you can contact Panda Security's support department through the console and automatically send all the information required for diagnosis. To do this, click Computers, select the computers with errors, and click the context menu. A menu will appear entitled Report a problem.

17.6. Allowing external access to the Web console

If the administrator finds problems they can't resolve, they can grant Panda Security's support team access to their console. Follow the steps below:
- Click the **Settings** menu at the top of the console. Then, click **Users** from the side menu.
- On the **Users** tab, click **Allow the Panda Security S.L. team to access my console.**
18. Alerts

Email alerts

18.1. Introduction

The alert system is a tool provided by Pand Endpoint Protection / Plus to quickly notify administrators of important situations to ensure the proper operation of the security service.

Namely, an alert will be sent to the administrator every time one of the following events occur:

- There is a change in the license status
- There are install errors or a computer is unprotected

18.2. Email alerts

Email alerts are messages sent by Pand Endpoint Protection / Plus to the administrator’s email account. As previously explained, the system will send a message to the configured recipients’ email accounts when certain events occur.

18.2.1 Configuring email alerts

Go to the Settings menu at the top of the Web console. Then click Alerts from the left-hand menu.

This screen lets administrators specify the email addresses to send messages to (Send the alerts to the following address). You can also enable and disable each of the alert types to send.

18.2.2 Access permissions and alerts

Alerts are defined independently for each user of the Web console. The contents displayed in an alert will vary depending on the managed computers that are visible to the recipient’s role.

18.2.3 Alert types

Malware detections

An alert message will be generated every 15 minutes if the following condition is met:

- Malware is detected in real time by an on-demand or scheduled scan.
- Compatible with Windows, Linux, macOS and Android devices.

The alert message will contain the following information:

- Number of malware threats detected within the time range.
- Number of affected computers.

Hacking tool & PUPS detections

An alert message will be generated every 15 minutes if the following condition is met:
A PUP or hacking tool is detected in real time by an on-demand or scheduled scan.
Compatible with Windows, Linux, macOS and Android devices.

The alert message will contain the following information:
- Number of threats detected within the time range.
- Number of affected computers.

**Alerts generated when a malware URL is blocked**
An alert message will be generated every 15 minutes if the following condition is met:
- A malware URL is detected.
- Compatible with Windows, Linux, macOS and Android devices.

The alert message will contain the following information:
- Number of malware URLs detected within the time range.
- Number of affected computers.

**Phishing detections**
An alert message will be generated every 15 minutes if the following condition is met:
- A phishing website or email is detected.
- Compatible with Windows, Linux, macOS and Android devices.

The alert message will contain the following information:
- Number of phishing attacks detected within the time range.
- Number of affected computers.

**Alerts generated when an intrusion attempt gets blocked**
An alert message will be generated every 15 minutes if the following condition is met:
- The IDS module blocks an intrusion attempt.
- Compatible with Windows computers.

The alert message will contain the following information:
Number of intrusion attempts detected within the time range.
Number of affected computers.

**Alerts generated when access to a device is denied**

An alert message will be generated every 15 minutes if the following condition is met:

- The user has accessed a peripheral device blocked by the administrator
- Compatible with Windows, Linux, macOS and Android devices.

The alert message will contain the following information:

- Number of device access attempts blocked.
- Number of affected computers.

**Installation errors**

These alerts have the following characteristics:

- An alert is generated for each computer on the network every time there is a situation that causes the computer's status to change from protected to unprotected.
- If several circumstances are detected at the same time that may cause a computer's status to change from protected to unprotected, only one alert will be generated with a summary of all those circumstances.
- The following computer statuses will trigger an alert:
  - **Protection with errors:** If the status of the antivirus and/or advanced protection installed on a computer shows an error, an alert will be generated. This only applies to those computers with an operating system that supports those protections.
  - **Installation error:** If an installation error occurs that requires user intervention (e.g., insufficient disk space), an alert will be generated. Temporary errors that can be resolved autonomously after a number of retries won't generate alerts.
  - **No license:** If a computer doesn't receive a license after registration because there are aren't any free licenses, an alert will be generated.
- The following computer statuses will not trigger an alert:
  - **No license:** No alerts are generated if the administrator manually removes a computer's license or when Panda Endpoint Protection / Plus automatically removes a computer's license because the number of purchased licenses has been reduced.
  - **Installing:** It doesn't make much sense to generate an alert every time the protection is installed on a computer on the network.
  - **Disabled protection:** This status is the consequence of a voluntary change of settings, so no alert is generated.
  - **Outdated protection:** This status doesn't necessarily mean that the computer is unprotected, despite its protection is out of date.
  - **Pending restart:** This status doesn't necessarily mean that the computer is unprotected.
  - **Outdated knowledge:** This status doesn't necessarily mean that the computer is unprotected.
The alert message will contain the following information:

- Computer name
- Protection status
- Reason for the change of status

**Protection and installation errors**

These alerts have the following characteristics:

- An alert is generated for each unprotected computer found on the network
- An alert is generated for each computer with a protection or install error

The alert message will contain the following information:

- Name of the unprotected computer
- Group to which the computer belongs
- Computer information (name, description, operating system, IP address, group, Active Directory path, domain)
- Detection date and time (in UTC format)
- Reason: **protection with errors** or **Install error**.

**Computers without a license**

These alerts have the following characteristics:

- An alert is generated every time the solution fails to assign a license to a computer due to lack of sufficient free licenses

The alert message will contain the following information:

- Name of the unprotected computer
- Group to which the computer belongs
- Computer information (name, description, operating system, IP address, group, Active Directory path, domain)
- Detection date and time (in UTC format)
- Reason: **computer without a license**

Additionally, an alert will also be generated under the following circumstances:

- Every time a license contract expires
The alert message will contain the following information:

- Number of computers that are left without a license
- Number of expired licenses
- Product whose licenses have expired
- License contract expiration date

**Discovery of an unmanaged computer**

An alert message will be generated if the following conditions are met:

- Every time a discovery computer completes a discovery task
- The discovery task finds never-seen-before computers on the network

The alert message will contain the following information:

- Name of the discovery computer.
- Number of discovered computers.
- Link to the list of all unmanaged computers discovered.
19. Reports

Roles and report generation
On-demand generation of executive reports
Scheduled sending of executive reports
19.1. Introduction

Panda Endpoint Protection / Plus allows administrators to generate and send, automatically or manually, executive reports that consolidate all the information collected by the solution in the selected period.

19.2. On-demand generation of executive reports

Go to the Status menu at the top of the console, and click the Executive report option from the left-hand menu. This will open the report settings window. This window is divided into two tabs: View and Schedule. Click the View tab to configure the executive report to display.

19.2.1 Information required to generate an on-demand report

The following information will be required:

- **Information for the following dates**: specify the time interval to be covered by the report
  - Last month
  - Last 7 days
  - Last 24 hours

- **Information for the following computers**: specify the computers to extract information from
  - All computers
  - Selected computers: displays the group tree. Use the checkboxes to select the groups you want.

- **Include the following content**: lets you select the type of information to be included in the report.
  - **License status**: shows the number of contracted and used licenses, and their expiration date. For more information, refer to chapter 5 Licenses.
  - **Network status**: shows the way the Panda Endpoint Protection / Plus software is working on those computers where it is installed. It includes information from the following dashboard widgets: unprotected computers and Outdated protection.
  - **Detections**: shows the threats detected across the network. It includes information collected from the following widgets and lists:
    - Top 10 computers with most detections
    - Threats detected by the antivirus
    - Content filtering on Exchange servers (Panda Endpoint Protection Plus only)
    - Web access and spam (Panda Endpoint Protection Plus only): shows the users' Internet activity. It includes information from the following dashboard widgets: web access, Top 10 most accessed categories, Top 10 most accessed categories by computer, Top 10 most blocked categories, Top 10 most blocked categories by computer and Spam detected on Exchange servers.
Once you have finished configuring the settings, click the View button to display the report in a new window.

Check that neither your Internet browser nor any installed extension blocks the display of pop-ups.

19.3. Scheduled sending of executive reports

Go to the Status menu at the top of the console, and click the Executive report option from the left-hand menu. This will open the report settings window. This window is divided into two tabs: View and Schedule. Click the Schedule tab to configure a scheduled executive report.

19.3.1 Information required to generate a scheduled report

The scheduled reports window displays a list of all configured reports. Click Add to add a new scheduled report. To delete a configured report, click the icon. To edit a configured report, click its name.

To configure a scheduled report, enter the following information:

- **Name**: name of the scheduled report that will be displayed on the list of configured reports.
- **Send automatically**: lets you schedule the sending of the executive report, or save the settings without sending the report.
- **Date and frequency**: lets you specify the day when the report will be sent and its frequency. Select Every day, Every week or Every month. The content of the drop-down menus will vary depending on your selection.
- **The following information**: this section displays the following settings: dates, Computers and Content. Click the arrow to the right to configure the following options:
  - **Information for the following dates**: specify the time interval to be covered by the report
    - Last month
    - Last 7 days
    - Last 24 hours
  - **Information for the following computers**: specify the computers to extract information from
    - All computers
    - **Selected computers**: displays the group tree. Use the checkboxes to select the groups you want.
  - **Include the following content**: lets you select the type of information to be included in the report
    - **License status**: shows the number of contracted and used licenses. For more information, refer to chapter 5 Licenses.
- **Network status**: shows the way the Panda Endpoint Protection / Plus software is working on those computers where it is installed. It includes information from the following dashboard widgets: **unprotected computers** and **Outdated protection**.

- **Detections**: shows all threats detected across the network. It includes information from the following dashboard widgets: **Threats detected by the antivirus** and **Content filtering for Exchange servers (Panda Endpoint Protection Plus only)**. Refer to chapter 15 Malware and network visibility for more information.

- **Web access and spam (Panda Endpoint Protection Plus only)**: shows the users’ Internet activity. It includes information from the following dashboard widgets: web access, Top 10 most accessed categories, Top 10 most accessed categories by computer, Top 10 most blocked categories, Top 10 most blocked categories by computer and Spam detected on Exchange servers.

- **To**: enter the email address that the report will be sent to. You can enter multiple addresses separated by commas.

- **CC**:

- **BCC**: use this field to send a copy of the report to a recipient without notifying other recipients that this was done.

- **Subject**: specify the email subject line.

- **Format**: select the format of the email attachment (the report): PDF, Excel, or Word.

- **Language**: select the language of the report.
20. Controlling and monitoring the management console

What is a user account?
What is a role?
What is a permission?
Accessing the user account and role settings
Creating and configuring user accounts
Creating and configuring roles
Activity log
20.1. Introduction

This chapter describes the resources implemented in Panda Endpoint Protection / Plus to control and monitor the actions taken by the network administrators that access the Web management console.

These resources are as follows:
- User accounts
- Roles assigned to user accounts
- User account activity log

20.2. What is a user account?

A user account is a resource managed by Panda Endpoint Protection / Plus, comprising a set of information that the system uses to regulate administrator access to the Web console and define the actions that administrators can take on users’ computers.

User accounts are only used by the administrators that access the Panda Endpoint Protection / Plus console. In general, each administrator will have a unique personal account, and it is possible to create as many accounts as necessary.

Unlike the rest of this manual, where the word “user” refers to the person that uses a computer or device, in this chapter “user” refers to the account used by the administrator to access the Web console.

20.2.1 User account structure

A user account comprises the following items:
- **Account login name**: this is assigned when the account is created and the aim is to identify the administrator accessing the account.
- **Account password**: this is assigned once the account is created and is designed to control access to the account.
- **Assigned role**: this can be selected once the user account is created. It lets you determine which computers the account user will be able to manage and the action they will be able to take.

20.2.2 What is the main user?

The main user is the user account provided by Panda Security to the customer when providing the Panda Endpoint Protection / Plus service. This account has the **Full control** role, which is explained below.
The settings of the main user cannot be edited or deleted.

20.3. What is a role?

A role is a set of permissions for accessing the console that are applied to one or more user accounts. This way, a specific administrator is authorized to view or edit certain resources in the console, depending on the role assigned to the user account with which they access the Panda Endpoint Protection / Plus console.

A user account can only have one role assigned. However, a role can be assigned to more than one user account.

20.3.1 Role structure

A role is made up of the following:

- **Role name**: this is purely for identification and is assigned when the role is created.
- **Groups the role grants permissions on**: this lets you restrict the network computers accessible to the user. Select the folders in the group tree that the user account has access to.
- **Set of permissions**: this lets you determine the specific actions that the user account can take on the computers included in the accessible groups.

20.3.2 Why are roles necessary?

In a small IT department, all technicians will typically access the console as administrators without any type of restriction. However, in mid-sized or large departments with large networks to run, it is highly likely that it will be necessary to organize or segment access to computers, under three criteria:

- **The number of computers to manage**.

With medium size or large networks or those in branches of an organization it may be necessary to assign computers to specific technicians. In this way, the devices in one office managed by a particular technician will be invisible to the technicians who manage the devices of other branches. It may also be necessary to restrict access to sensitive data by certain users. These cases will often require careful assignment of the technicians who will be able to access the devices with such data.

- **The purpose of the specific computer**.

Depending on its purpose, a computer may be assigned to a technician specialized in this field. For example, Exchange mail servers may be assigned to a group of specialized technicians, and other systems, such as Android devices, may not be visible to this group of technicians.
The knowledge or expertise of the technician.

Depending on the profile of the technician or their role within the IT department, they can be assigned simply monitoring or validation access (read only) or, on the other hand, more advanced access, such as permission to edit the security settings of computers. For example, it is not uncommon in large companies to find a certain group of technicians dedicated solely to deploying software on the network.

These three criteria can overlap each other, giving rise to a combination of settings that are highly flexible and easy to set up and maintain. It also makes it easy to define the functions of the console for each technician, depending on the user account with which they access the system.

20.3.3 Full Control role

The Panda Endpoint Protection / Plus license comes with the Full Control role predefined. The default administration account belongs to this role, and with this it is possible to take almost all actions that are available in the console.

The Full Control role cannot be deleted, edited or viewed, and any user account can belong to this role if it is assigned through the console.

20.3.4 Read-only role

It is especially designed for network administrators responsible for monitoring networks, but without sufficient permissions to take actions such as editing settings or launching on-demand scans.

The permissions enabled in the Monitoring Role are as follows:

- View security settings for workstations and servers
- View security settings for Android devices
- View patch management settings.
- View detections and threats
- View access to Web pages and spam (Panda Endpoint Protection Plus only).
- Access to advanced reports

20.4. What is a permission?

A permission regulates access to a particular aspect of the management console. There are 15 types of permissions that provide access to many aspects of the Panda Endpoint Protection / Plus console. A specific configuration from all available permissions generates a role, which can be assigned to one or more user accounts.

The Panda Endpoint Protection / Plus permissions are as follows:
- Manage users and roles
- Assign licenses
- Modify computer tree
- Add, discover and delete computers
- Configure proxies and language
- Modify per-computer settings (updates, passwords, etc.)
- Restart computers
- Configure security settings for workstations and servers
- View security settings for workstations and servers
- Configure security settings for Android devices
- View security settings for Android devices
- View detections and threats
- View access to Web pages and spam (Panda Endpoint Protection Plus only)
- Launch scan and disinfection tasks
- Exclude threats temporarily (malware, PUPs and blocked items)
- Configure patch management
- Install and uninstall patches
- View available patches

2.0.4.1 Understanding permissions

Below you will find a description of the permissions and their functions.

Manage users and roles
- **Enabled**: the account user can create, delete and edit user accounts and roles.
- **Disabled**: the account user cannot create, delete or edit user accounts or roles. It is possible to view registered users and account details, but not the list of roles created.

Assign licenses
- **Enabled**: the account user can assign and withdraw licenses for the managed computers.
- **Disabled**: the account user cannot assign or withdraw licenses, but can see if the computers have licenses assigned.

Modify the computer tree
- **Enabled**: the account user has complete access to the Groups tree, and can create and delete groups, as well as move computers to groups that have been created.
- **Enabled with permission conflict**: due to the inheritance rules, making changes to the Computers tree may involve changing the affected computers’ settings. If any of the permissions that allow administrators to change settings is disabled, they will only be permitted to create groups, delete empty groups and rename groups. The permissions that allow administrators to change settings are:
  - Modify network settings (proxies and cache)
- Modify per-computer settings (updates, passwords, etc.)
- Configure security settings for workstations and servers
- Configure security settings for Android devices
- Launch scan and disinfection tasks
- Configure patch management
- Install and uninstall patches

- **Disabled**: the account user can view the Groups tree and the settings assigned to each group, but cannot create new groups or move computers. They can change the settings assigned to a group, as this action is governed by the following permissions: **Configure security settings for workstations and servers**, **Configure security settings for Android devices**, **Configure patch management**.

**Add and delete computers**
- **Enabled**: the account user can distribute the installer to network computers and include computers with **Panda Endpoint Protection / Plus** installed in the console. They can also delete computers from the console.
- **Disabled**: the account user cannot download the installer, nor distribute it to computers. They cannot delete computers from the console.

**Add, discover and delete computers**
- **Enabled**: the account user can distribute the installer to their network computers and integrate them into the **Panda Endpoint Protection / Plus** console. They can also delete computers from the console and configure all aspects related to the discovery of unmanaged computers: assign and revoke the 'discovery computer' role, edit discovery settings, launch an immediate discovery task, and install the Panda agent remotely from the list of discovery computers.
- **Disabled**: the account user cannot download the installer, nor distribute it to computers. They cannot delete computers from the console or access the computer discovery feature.

**Modify network settings (proxies and cache)**
- **Enabled**: the account user can create new **Proxy and language** settings, edit or delete existing ones and assign them to computers in the console.
- **Disabled**: the account user cannot create new **Proxy and language** settings, nor edit or delete existing ones.

**Given that moving a computer in the Groups tree can change the assigned Proxy and language settings, when you disable Configure Proxies and languages you also have to disable the permission Modify Groups tree.**

**Modify per-computer settings (updates, passwords, etc.)**
- **Enabled**: the account user can create new **Per-computer settings**, edit or delete existing ones and assign them to computers in the console.
- **Disabled**: the account user cannot create new **Per-computer settings**, nor edit or delete existing ones.
Given that moving a computer in the Groups tree can change the assigned Per-computer settings, when you disable Modify per-computer settings you also have to disable the permission Modify Groups tree.

**Restart computers**
- **Enabled**: the account user can restart computers by going to the **Computers** menu and selecting **Restart** from the context menu (Windows workstations and servers, Linux and macOS).
- **Disabled**: the account user cannot restart computers.

**Configure security settings for workstations and servers**
- **Enabled**: the account user can create, edit, delete and assign security settings for Windows, Linux and macOS workstations and servers.
- **Disabled**: the account user cannot create, edit, delete or assign security settings for Windows, Linux and macOS workstations and servers.

When you disable this permission, you will see the permission **View security settings for workstations and servers**.

**View security settings for workstations and servers**
- **Enabled**: the account user can only see the security settings created as well as the settings of a computer or group.
- **Disabled**: the account user won’t be able to see the security settings created nor access the settings assigned to each computer.

**Configure security settings for Android devices**
- **Enabled**: the user account can create, edit, delete and assign settings for Android devices.
- **Disabled**: the user account will not be able to create, edit, delete or assign settings for Android devices.

Given that moving a computer in the Groups tree can change the assigned Android device settings, when you disable Configure security for Android devices you also have to disable the permission Modify Groups tree.
When you disable this permission, you will see the permission **View security settings for Android devices**, which is explained below.

**View security settings for Android devices**

- **Enabled**: the account user will be able to see the settings created for Android devices as well as the settings for a specific Android device or group.
- **Disabled**: the account user won’t be able to see the settings created for Android devices nor the settings for a specific Android device or group.

**View detections and threats**

- **Enabled**: the account user will be able to see the panels and lists in the **Security** section of the **Status** menu, and create new lists with custom filters.
- **Disabled**: the account user won’t be able to see the panels and lists in the **Security** section of the **Status** menu, nor create new lists with custom filters.

**View access to Web pages and spam**

- **Enabled**: the account user will be able to access the panels and lists in the **Web access and spam** section of the **Status** menu.
- **Disabled**: the account user won’t be able to access the panels and lists in the **Web access and spam** section of the **Status** menu.

**Launch scan and disinfection tasks**

- **Enabled**: the account user will be able to create, edit and delete scan tasks.
- **Disabled**: the account user won’t be able to create, edit or delete scan tasks. They will only be able to list the tasks and view the settings.

**Exclude threats temporarily (Malware, PUPs and blocked items)**

- **Enabled**: the account user can restore and prevent the detection of known classified threats. Similarly, they can also choose to stop allowing permitted threats.
- **Disabled**: the account user won’t be able to restore known classified threats or stop allowing permitted threats.
It is necessary to enable View detections and threats in order to fully implement Exclude threats temporarily (Malware, PUPs, and blocked items).

**Configure patch management**

- **Enabled**: the account user can create, edit, delete and assign patch management settings to Windows workstations and servers.
- **Disabled**: the account user won't be able to create, edit, delete or assign patch management settings to Windows workstations and servers.

Since moving a computer in the Groups tree can change the Patch management settings assigned to it, if you want to disable the Configure patch management permission you will also have to disable the Modify computer tree permission.

Disabling this permission displays the **View patch management settings** permission.

**View patch management settings**

This permission is only accessible when you disable the Configure patch management permission.

- **Enabled**: the account user can see the patch management settings created as well as the settings assigned to a computer or group. However, they cannot edit those settings.
- **Disabled**: the account user won't be able to see the patch management settings created nor access the settings assigned to each computer.

**Install /uninstall patches**

Since moving a computer in the Groups tree can change the Patch installation settings assigned to it, if you want to disable the Install patches permission you will also have to disable the Modify computer tree permission.

- **Enabled**: the account user can create patch installation and uninstallation tasks, and access the following lists: *Available patches*, *End-of-Life programs* and *Installation history*.
- **Disabled**: the account user won't be able to create patching tasks.

**View available patches**

This permission is only accessible when you disable the Install patches permission.
- **Enabled**: the account user can access the following lists: Patch management status, Available patches, ‘End-Of-Life’ programs and Installation history.
- **Disabled**: the account user won’t be able to access the following lists: Patch management status, Available patches, ‘End-Of-Life’ programs and Installation history.

### 20.5. Accessing the user account and role settings

In the **Settings** menu, when you click the **Users** panel, there are two sections associated with the management of roles and user accounts:

- **Users**: this lets you create new user accounts and define the roles they belong to.
- **Roles**: this lets you create and edit settings for accessing Panda Endpoint Protection / Plus resources.

The **Users and roles** settings are only accessible if the user has the permission **Manage users and roles**.

### 20.6. Creating and configuring user accounts

In the **Settings** menu, in the panel on the left, click **Users** and then the tab **Users** and you will be able to take all necessary actions related to the creation and editing of user accounts.

- **Add new user account**: click **Add** to add a new user, set the email account for accessing the account, the role to which it belongs, and a description of the account. The system will send an email to the account to generate the login password.
- **Edit a user account**: click the name of the user to display a window with all the account details that can be edited.
- **Delete or disable user accounts**: click the icon of a user account to delete it. Click a user account and select the button **Block this user** to temporarily block access to the Web console from this account. If the account is currently logged in it will be blocked immediately. Also, no email alerts will continue to be sent to the email addresses configured in the account’s settings.

### 20.7. Creating and configuring roles

In the **Settings** menu, click **Users** in the left-hand panel and then **Roles**, and you will be able to take all necessary actions related to the creation and editing of roles.

- **Add new role**: click **Add**. You will be asked for the name of the role, a description (optional), to select from the available computers, and a specific configuration of permissions.
- **Edit a role**: click the name of the role to display a window with all the settings that can be edited.
- **Copy a role**: click the icon to display a window with a new role with exactly the same settings as the original one.

- **Delete role**: click the icon of a role to delete it. If, when you delete a role, it already has user accounts assigned, the process of deleting it will be canceled.

### 20.8. User account activity log

**Panda Endpoint Protection / Plus** logs every action taken by network administrators in the Web management console. This way, it is very easy to find out who made a certain change, when and on which object.

To access the activity log, click the **Settings** menu at the top of the console, then click **Users** from the left-side menu, and select the **Activity** tab.

#### 20.8.1 Action log

The **Actions** section displays a list of all the actions taken by the user accounts, and allows you to export the information to an Excel file and filter the information.

**Fields displayed in the Actions list**

<table>
<thead>

21. Appendix 1: Panda Endpoint Protection / Plus requirements

Windows platforms
Windows Exchange platforms
macOS platforms
Linux platforms
Android platforms
Web console access
Access to service URLs
21.1. Requirements for Windows platforms

21.1.1 Supported operating systems

**Workstations**
- Windows XP SP3 (32 bits)
- Windows Vista
- Windows 7
- Windows 8 (32-bit and 64-bit)
- Windows 8.1 (32-bit and 64-bit)
- Windows 10 (32-bit and 64-bit)

**Servers**
- Windows 2003 (32-bit, 64-bit and R2) SP2 and later
- Windows 2008 (32-bit and 64-bit) and 2008 R2
- Windows Server 2012 R2
- Windows Server 2016 and 2019

21.1.2 Hardware requirements

- Processor: pentium 1 GHz
- RAM: 1 GB
- Free space disk for the installation: 650 MB

21.1.3 Other requirements

For the product to work correctly it is necessary to keep the root certificates of workstations and servers fully up to date. If this requirement is not met, some features such as the ability for agents to establish real-time communications with the management console or the Panda Patch Management module might stop working.

21.2. Requirements for Windows Exchange platforms

21.2.1 Supported operating systems

- Exchange 2010: Windows 2008 (64-bit) and Windows 2008 R2
21.2.2 Software and hardware requirements

The hardware requirements to install the protection on Exchange server are the ones determined by the Exchange server:

- Exchange 2003:
  [Link](http://technet.microsoft.com/en-us/library/cc164322(v=exchg.65).aspx)

- Exchange 2007:

- Exchange 2010:

- Exchange 2013

- Exchange 2016

21.2.3 Supported Exchange versions

- Microsoft Exchange Server 2003 Standard and Enterprise (SP1/SP2)
- Microsoft Exchange Server 2007 Standard and Enterprise (SP0/SP1/SP2/SP3)
- Microsoft Exchange Server 2007 included in Windows SBS 2008
- Microsoft Exchange Server 2010 Standard and Enterprise (SP0/SP1/SP2)
- Microsoft Exchange Server 2010 included in Windows SBS 2011
- Microsoft Exchange Server 2013 Standard and Enterprise
- Microsoft Exchange Server 2016 Standard and Enterprise

21.3. Requirements for macOS platforms

21.3.1 Supported operating systems

- macOS 10.10 Yosemite
- macOS 10.11 El Capitan
- macOS 10.12 Sierra
- macOS 10.13 High Sierra
- macOS 10.14 Mojave
21.3.2 Hardware requirements

- **Processor**: Intel Core 2 Duo.
- **RAM**: 2 GB.
- **Free space disk for installation**: 400 MB.
- **Ports**: ports 3127, 3128, 3129 and 8310 must be accessible for the Web anti-malware and URL filtering to work.

21.4. Requirements for Linux platforms

21.4.1 Supported 64-bit distributions

- Ubuntu 14.04 LTS, 14.10, 15.04, 15.10, 16.04 LTS and 16.10
- Fedora 23, 24 and 25

21.4.2 Supported kernel version

From version 3.13 up to version 4.10

21.4.3 Supported file managers

- Nautilus
- PCManFM
- Dolphin

21.4.4 Hardware requirements

- **Processor**: pentium 1 GHz.
- **RAM**: 1.5 GB.
- **Free space disk for installation**: 100 MB.
- **Ports**: ports 3127, 3128, 3129 and 8310 must be accessible for the Web anti-malware and URL filtering to work

21.4.5 Installation package dependencies

<table>
<thead>
<tr>
<th>debconf (&gt;= 0.5)</th>
<th>libfreetype6 (&gt;= 2.3.5)</th>
<th>libpng12-0 (&gt;= 1.2.13-4)</th>
<th>libxcb1</th>
</tr>
</thead>
<tbody>
<tr>
<td>dkms (&gt;= 1.95)</td>

</tr>
</tbody>
</table>
### 21.5. Android platform requirements

#### 21.5.1 Supported operating systems

- Ice Cream Sandwich 4.0
- Jelly Bean 4.1 - 4.2 - 4.3
- KitKat 4.4
- Lollipop 5.0/5.1
- Marshmallow 6.0
- Nougat 7.0 - 7.1
- Oreo 8.0

#### 21.5.2 Hardware requirements

A minimum of 10 MB of internal memory is required. Depending on the model, it is possible that the required space be larger.

#### 21.5.3 Network requirements

For the push notifications to work correctly from the company’s network, it is necessary to open ports 5228, 5229 and 5230 to the whole set of ASN 15169 IP addresses belonging to Google.

### 21.6. Web console access

The **Panda Endpoint Protection / Plus** management console can be accessed with the latest version of the following compatible browsers.

- Chrome
- Internet Explorer
- Microsoft Edge
- Firefox
- Opera

### 21.7. Access to service URLs

In order to install and operate **Panda Endpoint Protection / Plus** correctly, you need to allow access to the following URLs.
- https://*.pandasecurity.com
- http://*.pandasecurity.com
- https://*.windows.net
- https://pandasecurity.logtrust.com
- http://*.pandasoftware.com
- http://*.globalsign.com
- http://*digicert.com

**Inbound and outbound traffic (anti-spam and URL filtering)**
- http://*.pand.ctmail.com
- http://download.ctmail.com

**Ports**
- Port 80 (HTTP, websocket)
- Port 443 (HTTPS)

**Patch and update download (Panda Patch Management)**
Refer to the following support article [https://www.pandasecurity.com/uk/support/card?id=700044](https://www.pandasecurity.com/uk/support/card?id=700044) for a full list of the URLs that must be accessible by the network computers that will receive patches, or by the network computers with the cache/repository role.
22. Appendix 2: creating and managing a Panda Account

Creating a Panda Account
Activating your Panda Account
22.1. Introduction

A Panda Account provides administrators with a safer mechanism to register and access the Panda Security services purchased by the organization, than the old method of receiving the relevant access credentials by email.

With a Panda Account, it is the administrator who creates and activates the access credentials to the Panda Endpoint Protection / Plus Web console.

22.2. Creating a Panda Account

Follow the steps below to create a Panda Account.

Open the email message received from Panda Security
- After purchasing Panda Endpoint Protection / Plus, you will receive an email message from Panda Security.
- Click the link in the message to access a site from which you will be able to create your Panda Account.

Fill out the form
- Fill out the form with the relevant data.
- Use the drop-down menu in the bottom-right corner if you want to change the language of the form.
- You can view the license agreement and privacy policy by clicking the corresponding links.
- Click Create to receive a message at the email address entered in the form. Follow the instructions in that message to activate your account.

22.3. Activating your Panda Account

Once you have created your Panda Account you will need to activate it. You can do this through the email message that you will receive at the email address you specified when creating your Panda Account.

- Find the message in your Inbox.
- Click the activation button. By doing that you will validate the email address that you provided when creating your Panda Account. If the button doesn’t work, copy and paste the URL included in the message into your browser.
- The first time that you access your Panda Account you will be asked to confirm your password. Then, click Activate account
- Enter the required data and click Save data. If you prefer to enter your data later, click Not now.
- Accept the terms and conditions of the License Agreement and click OK.
Once your Panda Account has been successfully activated, you will be taken to the Panda Cloud site home page. There, you will be able to access your Panda Endpoint Protection / Plus Web console. To do that, simply click the solution's icon in the My Services section.
23. Appendix 3: list of uninstallers
On installing **Panda Endpoint Protection / Plus**, other security products might be detected on the computer. In that case, Table 60 shows the products that will be automatically uninstalled before installing **Panda Endpoint Protection / Plus** across the network.

</tr>
</tbody>
</table>
*AVG Internet Security Business Edition 2011 (64-bit) (10.0.1375) - During the installation process of the Panda Endpoint Protection agent, the user will be prompted to select the Allow option in several windows.

* Kaspersky Anti-Virus 6.0 for Windows workstations:

During the installation process of the Panda Endpoint Protection agent on 64-bit platforms, the user will be prompted to select the Allow option in several windows.

To be able to uninstall the protection, the Kaspersky protection must not be password-protected.

Upon uninstalling the program, if UAC is enabled, the user will be prompted to select the option Allow in the UAC window.

* F-Secure PSB for Workstations 9.00 - During the installation process of the Panda Endpoint Protection agent, the user will be prompted to select the Allow option in two windows.

* AVG Anti-Virus Network Edition 8.5 - During the installation process of the Panda Endpoint Protection agent, the user will be prompted to select the Allow option in two windows.

* Panda Antivirus 2011 products do not uninstall correctly on 64-bit platforms. Upon uninstalling the program, if UAC is enabled, the user will be prompted to select the option Allow in the UAC window.

* Panda Cloud Antivirus 1.4 Pro and Panda Cloud Antivirus 1.4 Free - Upon uninstalling the program, if UAC is enabled, the user will be prompted to select the option Allow in the UAC window.

* Trend Micro - PC-Cillin Internet Security 2007 and 2008 cannot be uninstalled automatically on Windows Vista x64 systems.

* Trend Micro - PC-Cillin Internet Security 2007 and 2008 cannot be uninstalled automatically on Windows Vista x64 systems with UAC enabled.

* ESET NOD32 Antivirus 3.0.XX (2008) does not uninstall automatically on Windows Vista x64 systems.

* ESET NOD32 Antivirus 2.7*: after installing the Panda Endpoint Protection agent on the computer, the system will restart automatically without displaying any notifications or asking for user confirmation.

* ESET NOD32 Antivirus 2.70.39*: after installing the Panda Endpoint Protection agent on the computer, the system will restart automatically without displaying any notifications or asking for user confirmation.

* ESET Smart Security 3.0 does not uninstall automatically on Windows Vista x64 systems.

* Sophos Anti-virus SBE 2.5 does not uninstall correctly on Windows 2008 systems.

* eTrust Antivirus 7.1 does not uninstall correctly on 64-bit platforms.
* Norton Antivirus Internet Security 2008 does not uninstall correctly if the Windows Vista UAC is enabled.

* BitDefender Free Edition 2009 12.0.12.0: on Windows Vista systems with UAC enabled, if the user tries to uninstall the program, they will be prompted to select the option Allow in the UAC window.

* Kaspersky Anti-Virus 2010 9.0.0.459: on systems with UAC enabled, if the user tries to uninstall the program, they will be prompted to select the option Allow in the UAC window.

* Kaspersky Anti-Virus 8: on Windows Vista systems with UAC enabled, if the user tries to uninstall the program, they will be prompted to select the option Allow in the UAC window.

* McAfee Total Protection Services 4.7. The uninstaller does not run correctly if UAC is enabled. Furthermore, 32-bit platforms require user intervention.

* Microsoft Live OneCare 2.5 does not uninstall correctly on Windows Small Business Server 2008.

If you have a program not included on this list, contact the relevant vendor to find out how to uninstall it before installing Panda Endpoint Protection / Plus on Aether.
24. Appendix 4: key concepts
Active Directory
Proprietary implementation of LDAP (Lightweight Directory Access Protocol) services for Microsoft Windows computers. It enables access to an organized and distributed directory service for finding a range of information on network environments.

Adware
Program that automatically runs, displays or downloads advertising to the computer.

Alert
See Incident.

Anti-spam
Technology that searches for unwanted email based on its contents.

Anti-Tamper protection
A set of technologies aimed at preventing tampering of the Panda Endpoint Protection / Plus processes by unauthorized users and APTs looking for ways to bypass the security measures in place.

Antivirus
Protection module that relies on traditional technologies (signature files, heuristic scanning, anti-exploit techniques, etc.), to detect and remove computer viruses and other threats.

ARP (Address Resolution Protocol)
A telecommunication protocol used for resolution of Internet layer addresses into link layer addresses. On IP networks, this protocol translates IP addresses into physical MAC addresses.

Automatic assignment of settings
See Inheritance.

Backup
Storage area for non-disinfectable malicious files, as well as the spyware items and hacking tools detected on your network. All programs classified as threats and removed from the system are temporarily moved to the backup/quarantine area for a period of 7/30 days based on their type.

Broadcasting
In computer networking, broadcasting refers to transmitting a packet that will be received by every device on the network simultaneously, without the need to send it individually to each device. Broadcast packets don’t go through routers and use different addressing methodology to differentiate them from unicast packets.

Cache/Repository (role)
Computers that automatically download and store all files required so that other computers with Panda Endpoint Protection / Plus installed can update their signature file, agent and protection
engine without having to access the Internet. This saves bandwidth as it won’t be necessary for each computer to separately download the updates they need. All updates are downloaded centrally for all computers on the network.

**Cloud (Cloud computing)**

Cloud computing is a technology that allows services to be offered across the Internet. Consequently, the term ‘the cloud’ is used as a metaphor for the Internet in IT circles.

**Computers without a license**

Computers whose license has expired or are left without a license because the user has exceeded the maximum number of installations allowed. These computers are not protected, but are displayed in the Web management console.

**Device control**

Module that allows organizations to define the way protected computers must behave when connecting a removable or mass storage device to them.

**DHCP**

Service that assigns an IP address to each computer on a network.

**Dialer**

Program that redirects users that connect to the Internet using a modem to a premium-rate number. Premium-rate numbers are telephone numbers for which prices higher than normal are charged.

**Discovery computer (role)**

Computers capable of finding unmanaged workstations and servers on the network in order to remotely install the *Panda Endpoint Protection / Plus* agent on them.

**Disinfectable file**

A file infected by malware for which there is an algorithm that can convert the file back to its original state.

**Domain**

Windows network architecture where the management of shared resources, permissions and users is centralized in a server called a Primary Domain Controller (PDC) or Active Directory (AD).

**Domain Name System (DNS)**

Service that translates domain names into different types of information, generally IP addresses.

**Dwell time**

Length of time that a threat has remained undetected on the network.
Panda Endpoint Protection / Plus software
Program installed on the computers to protect. It consists of two modules: the Panda agent and the protection.

End-of-Life (EOL)
A term used with respect to a product supplied to customers, indicating that the product is in the end of its useful life. Once a product reaches its EOL stage, it stops receiving updates or fixes from the relevant vendor, leaving it vulnerable to hacking attacks.

Environment variable
A string consisting of environment information such as a drive, path or file name, which is associated with a symbolic name that Windows can use. You can use the System applet in the Control Panel or the 'set' command at the command prompt to set environment variables.

Exchange server
Mail server developed by Microsoft. Exchange servers store inbound and/or outbound emails and distribute them to users' email inboxes.

Excluded program
Programs that were initially deleted as they were classified as malware or PUP, but have been selectively and temporarily allowed by the administrator, who excluded them from the scans performed by the solution.

Exploit
Generally speaking, an exploit is a sequence of specially crafted data aimed at causing a controlled error in the execution of a vulnerable program. Once the error occurs, the compromised process will mistakenly interpret certain parts of the data sequence as executable code, taking malicious actions that may compromise the security of the target computer.

Filter
A dynamic-type computer container that automatically groups together those items that meet the conditions defined by the administrator. Filters simplify the assignment of security settings, and facilitate management of all computers on the network.

Filter tree
Collection of filters grouped into folders, used to organize all computers on the network and facilitate the assignment of settings.

Firewall
Technology that blocks the network traffic that coincides with certain patterns defined in rules established by the administrator. A firewall prevents or limits the communications established by the applications run on computers, reducing the attack surface.
Folder tree
Hierarchical structure consisting of static groups, used to organize all computers on the network and facilitate the assignment of settings.

Fragmentation
On data transmission networks, when the MTU of the underlying protocol is not sufficient to accommodate the size of the transmitted packet, routers divide the packet into smaller segments (fragments) which are routed independently and assembled in the right order at the destination.

Geolocation
Geographical positioning of a device on a map from its coordinates.

Goodware
A file which, after analysis, has been classified as legitimate and safe.

Group
Static container that groups one or more computers on the network. Computers are assigned to groups manually. Groups simplify the assignment of security settings, and facilitate management of all computers on the network.

Hacking tool
Programs used by hackers to carry out actions that cause problems for the user of the affected computer (allowing the hacker to control the computer, steal confidential information, scan communication ports, etc.).

Heuristic scanning
Static scanning that employs a set of techniques to inspect suspicious programs based on hundreds of file characteristics. It can determine the likelihood that a program may take malicious actions when run on a user's computer.

Hoaxes
Spoof messages, normally emails, warning of viruses/threats which do not really exist.

ICMP (Internet Control Message Protocol)
Error notification and monitoring protocol used by the IP protocol on the Internet.

IDP (Identity Provider)
Centralized service for managing user identity verification.

Indirect assignment of settings
See Inheritance.
Infection vector
The means used by malware to infect users' computers. The most common infection vectors are Web browsing, email and pen drives.

Inheritance
A method for automatically assigning settings to all subsets of a larger, parent group, saving management time. Also referred to as 'automatic assignment of settings' or 'indirect assignment of settings'.

IP address
Number that identifies a device interface (usually a computer) logically and hierarchically on a network that uses the IP protocol.

IP (Internet Protocol)
Principal Internet communications protocol for sending and receiving datagrams generated on the underlying link level.

Joke
These are not viruses, but tricks that aim to make users believe they have been infected by a virus.

Linux distribution
Set of software packages and libraries that comprise an operating system based on the Linux kernel.

MAC address
48-bit hexadecimal number that uniquely identifies a network card or interface.

Malware
This term is used to refer to all programs that contain malicious code (MALicious softWARE), whether it is a virus, Trojan, worm or any other threat to the security of IT systems. Malware tries to infiltrate or damage computers, often without users knowing, for a variety of reasons.

Malware Freezer
A feature of the quarantine/backup module whose goal is to prevent data loss due to false positives. All files classified as malware or suspicious are sent to the quarantine/backup area, thereby avoiding deleting and losing data if the classification is wrong.

Manual assignment of settings
Direct assignment of a set of settings to a group, as opposed to the automatic or indirect assignment of settings, which uses the inheritance feature to assign settings without administrator intervention.
**MD5 (Message-Digest Algorithm 5)**
A cryptographic hash function producing a 128-bit value that represents data input. The MD5 hash value calculated for a file is used to identify it unequivocally or check that it has not been tampered with.

**MTU (Maximum Transmission Unit)**
Maximum packet size (in bytes) that the transport will transmit over the underlying network.

**Network adapter**
Hardware that allows communication among different computers connected through a data network. A computer can have more than one network adapter installed, and is identified in the system through a unique identifier.

**Network topology**
Physical or logical map of network nodes.

**OU (Organizational Unit)**
Hierarchical method for classifying and grouping objects stored in directories.

**Panda agent**
One of the modules included in the Panda Endpoint Protection / Plus software. It manages communications between computers on the network and Panda Security’s cloud-based servers, in addition to managing local processes.

**Panda Patch Management**
A module compatible with Panda Endpoint Protection / Pro that updates and patches the programs installed on an organization’s workstations and servers in order to remove the software vulnerabilities stemming from programming bugs and reduce the attack surface.

**Partner**
A company that offers Panda Security products and services.

**Patch**
Small programs published by software vendors to fix their software and add new features.

**PDC (Primary Domain Controller)**
This is the role of a server on Microsoft domain networks, which centrally manages the assignment and validation of user credentials for accessing network resources. Active Directory currently exercises this function.

**Peer to Peer (P2P) functionality**
Information transfer mechanism that uses the network bandwidth more efficiently on networks with nodes that work simultaneously as clients and servers, establishing a direct two-way communication.
Panda Endpoint Protection / Plus implements P2P connections to reduce bandwidth usage, as those computers whose signature file has been already updated will share the update locally with those computers that also need to update it.

Phishing
A technique for obtaining confidential information from a user fraudulently. The targeted information includes passwords, credit card numbers and bank account details.

Port
Unique ID number assigned to a data channel opened by a process on a device through which data is exchanged (inbound/outbound) with an external source.

Potentially Unwanted Program (PUP)
A program that may be unwanted, despite the possibility that users consented to download it. Potentially unwanted programs are often downloaded inadvertently along with other programs.

Protection (module)
One of the two components of the Panda Endpoint Protection / Plus software which is installed on computers. It contains the technologies responsible for protecting the IT network, and the remediation tools used to disinfect compromised computers and assess the scope of the intrusion attempts detected on the customer's network.

Protocol
System of rules and specifications in telecommunications that allows two or more computers to communicate. One of the most commonly used protocols is TCP-IP.

Proxy
Software that acts as an intermediary for the communication established between two computers: a client on an internal network (an intranet, for example) and a server on an extranet or the Internet.

Proxy (role)
A computer that acts as a gateway to allow workstations and servers without direct Internet access to connect to the Panda Endpoint Protection / Plus cloud.

Proxy functionality
This feature allows Panda Endpoint Protection / Plus to operate on computers without Internet access, accessing the Web through an agent installed on another computer on the same subnet.

Public network
Networks in public places such as airports, coffee shops, etc. These networks require that you establish some limitations regarding computer visibility and usage, especially with regard to file, directory and resource sharing.
QR (Quick Response) code
A matrix of dots that efficiently stores data.

Quarantine
See Backup.

RIR (Regional Internet Registry)
An organization that manages the allocation and registration of IP addresses and Autonomous Systems (AS) within a particular region of the world.

Role
Specific permission configuration applied to one or more user accounts, and which authorizes users to view and edit certain resources of the console.

Rootkit
A program designed to hide objects such as processes, files or Windows registry entries (often including its own). This type of software is used by attackers to hide evidence and utilities on previously compromised systems.

RWD (Responsive Web Design)
A set of techniques that enable the development of Web pages that automatically adapt to the size and resolution of the device being used to view them.

SCL (Spam Confidence Level)
Normalized value assigned to a message that indicates the likelihood that the message is spam, based on its characteristics (content, headers, etc.)

Settings
See Settings profile.

Settings profile
Specific settings governing the protection or any other aspect of the managed computer. Profiles are assigned to a group or groups and then applied to all computers that make up the group.

Signature file
File that contains the patterns used by the antivirus to detect threats.

SMTP server
Server that uses SMTP (Simple Mail Transfer Protocol) to exchange email messages between computers.
**Spam**
This term refers to unsolicited email messages that usually contain advertising and are generally sent out massively. Spam can have a range of negative effects on the recipient.

**Spyware**
A program that is automatically installed with another (usually without the user’s permission and even without the user realizing), and collects personal data.

**Suspicious item**
A program with a high probability of being malware after having been scanned by the Panda Endpoint Protection / Plus protection installed on the user’s computer.

**SSL (Secure Sockets Layer)**
Cryptographic protocol for the secure transmission of data sent over the internet.

**SYN**
Flag in the TOS (Type Of Service) field of TCP packets that identifies them as connection start packets.

**Task**
Set of actions scheduled for execution at a configured frequency during a specific period of time.

**TCO (Total Cost of Ownership)**
Financial estimate of the total direct and indirect costs of owning a product or system.

**TCP (Transmission Control Protocol)**
The main transport-layer Internet protocol, aimed at connections for exchanging IP packets.

**TLS (Transport Layer Security)**
New version of protocol SSL 3.0.

**Trojans**
Programs that reach computers disguised as harmless software to install themselves on computers and carry out actions that compromise user confidentiality.

**Trusted network**
Networks in private places such as offices and households. Connected computers are generally visible to the other computers on the network, and there is no need to establish limitations on file, directory and resource sharing.

**UDP (User Datagram Protocol)**
A transport-layer protocol which is unreliable and unsuited for connections for exchanging IP packets.
User (console)
Information set used by Panda Endpoint Protection / Plus to regulate administrator access to the Web console and establish the actions that administrators can take on the network’s computers.

User (network)
A company’s workers using computing devices to do their job.

User account
See User.

Virus
Programs that can enter computers or IT systems in a number of ways, causing effects that range from simply annoying to highly-destructive and irreparable.

VPN (Virtual Private Network)
Network technology that allows private networks (LAN) to interconnect across a public medium, such as the Internet.

Web access control
Technology that allows organizations to control and filter the URLs requested by the network’s Internet browsers in order to allow or deny access to them, taking as reference a URL database divided into content categories.

Web console
Tool to manage the advanced security service Panda Endpoint Protection / Plus, accessible anywhere, anytime through a supported Internet browser. The Web console allows administrators to deploy the security software, push security settings, and view the protection status.

Widget (Panel)
Panel containing a configurable graph representing a particular aspect of network security. Panda Endpoint Protection / Plus’s dashboard is made up of different widgets.

Workgroup
Architecture in Windows networks where shared resources, permissions and users are managed independently on each computer.
