"It was very important for us that the solution to be introduced should provide not 'just' virus protection, but a complex service. Our choice has been completely justified in the time since then."

*András Neuliszt
IT professional*

History

After founding the corporate group in 2004, the first major IT development took place in 2006, which was not followed by a comprehensive antivirus strategy at a similar level. A few years later, we changed to the excellent Panda Antivirus for Business system, which had local central management at that time. In later developments, the cloud-based console became available, so the antivirus system was replaced by the Panda Endpoint Protection version. This was significantly more advanced than the previous version, but there were cases giving grounds for increased protection against zero-day malware.

Challenge

The further infrastructural development of the company, the surging amount of data, the irreplaceable nature of the data stored on the servers and the increasing threat of varied ransomware were grounds for the management to rethink protection demands and possibilities.

Solution

Upon our inquiry, the IT vendor for the corporate group informed us that the protection system from Panda Adaptive Defense 360 exactly met our demands. We thoroughly tested the versatile settings during a presentation. It was very important for us that the solution to be introduced should provide not "just" virus protection, but a complex service. Our choice has been completely justified in the time since then. Thanks to the web-based central interface, the processes can be intervened in from anywhere. Automated and scheduled monitoring can be performed by grouping the computers. Users can be granted different permissions through group settings. The protection of external tools, Exchange protection and spam filtering play a key role. The firewall module in the software package excellently completes our existing solution. Thanks to its protection against zero-day malware, the previously experienced threats have disappeared. Moreover, updating our own software programs is also secure, since the system monitors them upon each update.

Information about the Company

Mezort Zrt., a fully Hungarian-owned company, is the largest agricultural company in the West Transdanubian region. The corporate group, including three large agricultural companies, was founded in January 2004. Our major activities include milk production, crop production and related activities, as well as pig farming and marketing.
